

# Smart RPA Enterprise Playbook

October 2018

# Table of contents (page 1 of 2)

Topic	Page no.
<b>Objective of the Playbook</b>	<b>4</b>
<b>Section I: Introduction to Smart RPA</b>	<b>5</b>
• Smart RPA adoption drivers	6
• Defining Smart RPA	11
• Next-generation workforce	14
• Benefits of Smart RPA	18
• Key challenges and best practices	20
<b>Section II: Enterprise Smart RPA journey</b>	<b>22</b>
• Understand current state and market capabilities	24
• Building a business case – what is the right outcome target state?	31
• Determining the capabilities required to achieve identified outcomes	34
• Identify all determinants and map path	40
• Execute against mapped path	47
<b>Section III: Accelerating the Smart RPA journey</b>	<b>48</b>
• Identifying and prioritizing processes for Smart RPA adoption	49
• Optimizing processes before automating	52
• Selecting enterprise-grade Smart RPA tools	55
• Establishing and executing a Smart RPA CoE	67
• Identifying and sourcing Smart RPA skills	79
• Developing an effective change management program	85

# Table of contents (page 2 of 2)

Topic	Page no.
<b>Section IV: Enterprise case studies</b>	<b>91</b>
<b>Section V: Pinnacle Enterprise™ Smart RPA maturity model</b>	<b>104</b>
• Assessment of Smart RPA capability maturity	106
• Assessment of Smart RPA outcomes	128
<b>Section VI: Developing the business case for Smart RPA</b>	<b>131</b>
• Key assumptions and framework for assessment	132
• Aggregated business case for an enterprise	135
• Business case for front-office operations	140
• Business case for back-office operations – F&A	149
• Business case for back-office operations – P&C insurance processes	158
<b>Appendix</b>	<b>162</b>
• Appendix A: Digital workforce and the office of the future	163
• Appendix B: Enterprises' environmental determinants	168
• Appendix C: Variations in execution steps	172
• Appendix D: Establishing a Smart RPA CoE	178
• Appendix E: Glossary of key terms	197

## Objective

The aim of the Smart RPA Playbook is to empower enterprises at various stages of their Smart RPA journeys with insights, methodologies, and practical advice to help develop winning strategies to achieve best-in-class business outcomes from their Smart RPA investments

# Key content

---

- **Introduction to Smart RPA**

- Enterprise Smart RPA journey
- Accelerating the Smart RPA journey
- Enterprise case studies
- Pinnacle Enterprises™ Smart RPA maturity model
- Developing the business case for Smart RPA
- Appendix

# Enterprises' key business objectives/imperatives are evolving to remain competitive in the market

Legacy business

Drivers of change

Digital-first business

## Value

Cost reduction

Efficient process

Service Level Agreement (SLA)  
reporting

## Levers

Shared services

Labor arbitrage

Lean Six Sigma

Legacy tools and wrappers

Benefits from traditional processes – such as shared services, offshore labor arbitrage, and Enterprise Resource Planning (ERP) – have started to reach saturation

Challenges from increasing administrative expenses due to expanding coverage and regulatory stringency

The need to keep pace and remain competitive with evolving customer expectations and business situations in a digital-first world

## Value

Maximize profits

Eliminate manual work

Reimagine processes

Focus on business metrics

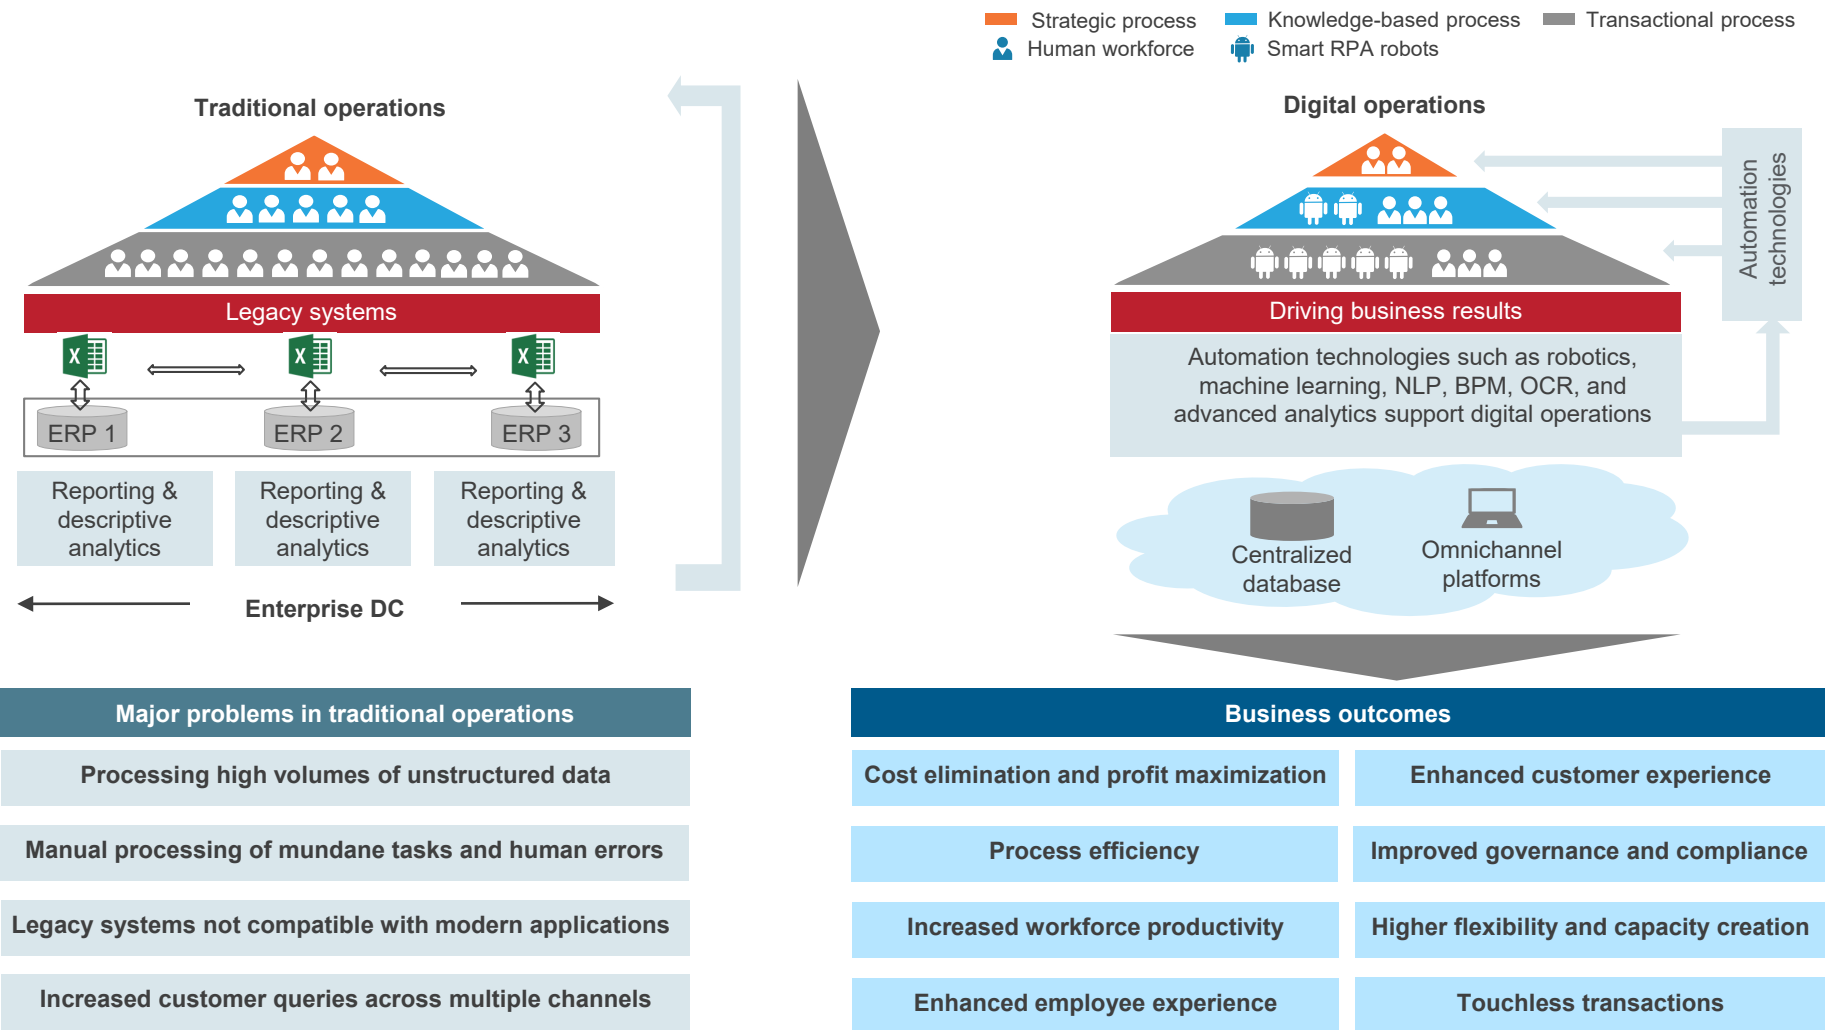

## Levers

Digital tools and  
automation technologies

Design thinking

Deep domain expertise

# Manual operations are being transformed to digital, automated, and smart business processes to achieve business outcomes

# Smart RPA is a core capability to enable the change to digital, automated, and smart business processes...

## Factors driving the adoption of Smart RPA among enterprises

-  **Enhancing customer experience, disrupting competition, and top-line growth**  
Smart RPA enables enterprises to differentiate themselves with a digitally-enabled customer experience and faster time-to-market for new products and services, and thus disrupt competition and attract and retain new customers that are digital-friendly
-  **Laying the groundwork for a broader digital transformation agenda**  
As automation requires the creation of at least business unit-level transformation to realize potential, it allows enterprises to create a roadmap to digitally enable their organizations and drive an enterprise-wide digital agenda
-  **Increasing operational efficiency and quality**  
Process automation results in faster turnaround time and reduction in human errors. Also, data generated by Smart RPA could be used to further identify and eradicate operational inefficiencies
-  **Increasing employee productivity and improving experience**  
Robots are usually deployed in part of a process, working beside a human. Human resources freed from mundane tasks can focus on higher value tasks and handle more transactions in the same timeframe
-  **Improve governance and compliance**  
Robust audit trail can be conducted for all the activities that robots perform, which leads to sound traceability and improved process governance & compliance
-  **Cost-savings**  
Smart RPA results in significant cost reduction through both people and non-people (such as infrastructure) savings. Additionally, there are savings on hiring and new employee onboarding and training costs

# ...and it has application across industry verticals and functions

Smart RPA adoption potential by buyer industry and function

Potential for Smart RPA Low High

• XX Illustrative processes with higher potential

Banking & financial services						<ul style="list-style-type: none"> <li>• Cards activation</li> <li>• Customer onboarding</li> </ul>
Insurance						<ul style="list-style-type: none"> <li>• Claims processing</li> <li>• New business preparation</li> </ul>
Healthcare & pharma						<ul style="list-style-type: none"> <li>• Reports automation</li> <li>• System reconciliation</li> </ul>
Manufacturing & retail						<ul style="list-style-type: none"> <li>• Bills Of Material (BOM) generation</li> </ul>
Hi-tech & telecom						<ul style="list-style-type: none"> <li>• Service order management</li> <li>• Quality reporting</li> </ul>
Travel & logistics						<ul style="list-style-type: none"> <li>• Passenger revenue accounting</li> <li>• Ticketing</li> </ul>
	<b>F&amp;A</b>	<b>Procurement</b>	<b>Human resource</b>	<b>Contact center</b>	<b>Industry-specific processes</b>	
	<ul style="list-style-type: none"> <li>• GL &amp; reporting</li> <li>• AR &amp; cash management</li> <li>• AP &amp; expense reporting</li> </ul>	<ul style="list-style-type: none"> <li>• Invoice processing</li> <li>• PO processing</li> <li>• Inventory management</li> </ul>	<ul style="list-style-type: none"> <li>• Leave application</li> <li>• Payroll variation checking</li> <li>• New joiners and leavers</li> </ul>	<ul style="list-style-type: none"> <li>• Level-1 and -2 queries</li> <li>• Customer data management</li> </ul>		

# Case study: Developing digital capabilities for invoice processing using a Smart RPA solution

## Business Problem

- Manual processing of high volumes of documents and unstructured data from customers through various channels including email, paper, fax, post, social media, and other electronic data streams on a daily basis
- High manual errors in processing documents, processing time, and cost of operations

## Business objectives

- Provide better customer experience and enhance customer satisfaction
- Reduce manual errors
- Reduce cost of operations (i.e., decrease resources needed for manual processes)

## Smart RPA solution

- A Smart RPA solution was implemented to develop digital capabilities for invoice processing
- The solution reads, interprets, and extracts key data from invoices and validates them against compliance and legal requirements
- Exceptions are automatically routed to human agents and the solution learns from the actions
- The validated structured data is automatically entered into the enterprise's ERP system

## Business outcomes

- About **67%** reduction in the number of FTEs needed in the process
- Reduction in the amount of incorrect data generated due to human errors and considerable increase in process accuracy
- About **20%** reduction in the number of helpdesk queries and enhanced customer satisfaction

# What is Smart RPA?: Solutions that combine RPA and AI technologies to automate business processes

## Smart RPA

RPA and AI solutions augment each other to form a Smart RPA solution that is essential for dramatic impact and that can achieve desired business outcomes

### Key characteristics

#### Robotic Process Automation (RPA)

- Mimics a user's activities
- Follows a non-invasive approach
- Can process structured and some semi-structured data
- Rules-based automation; no learning capabilities
- Highly deterministic; used mostly for transactional activities and standardized processes

#### Artificial Intelligence (AI)

- Mimics human thought process through vision, language, and pattern detection
- Can augment RPA by processing unstructured data
- Can “learn” or improve its performance over time without being explicitly programmed, based on data collected
- Probabilistic but can have safeguards to make it deterministic

### Differentiating capabilities

- Screen scraping
- Rules engine
- Basic analytics
- Library of pre-built automations
- Robot performance analytics

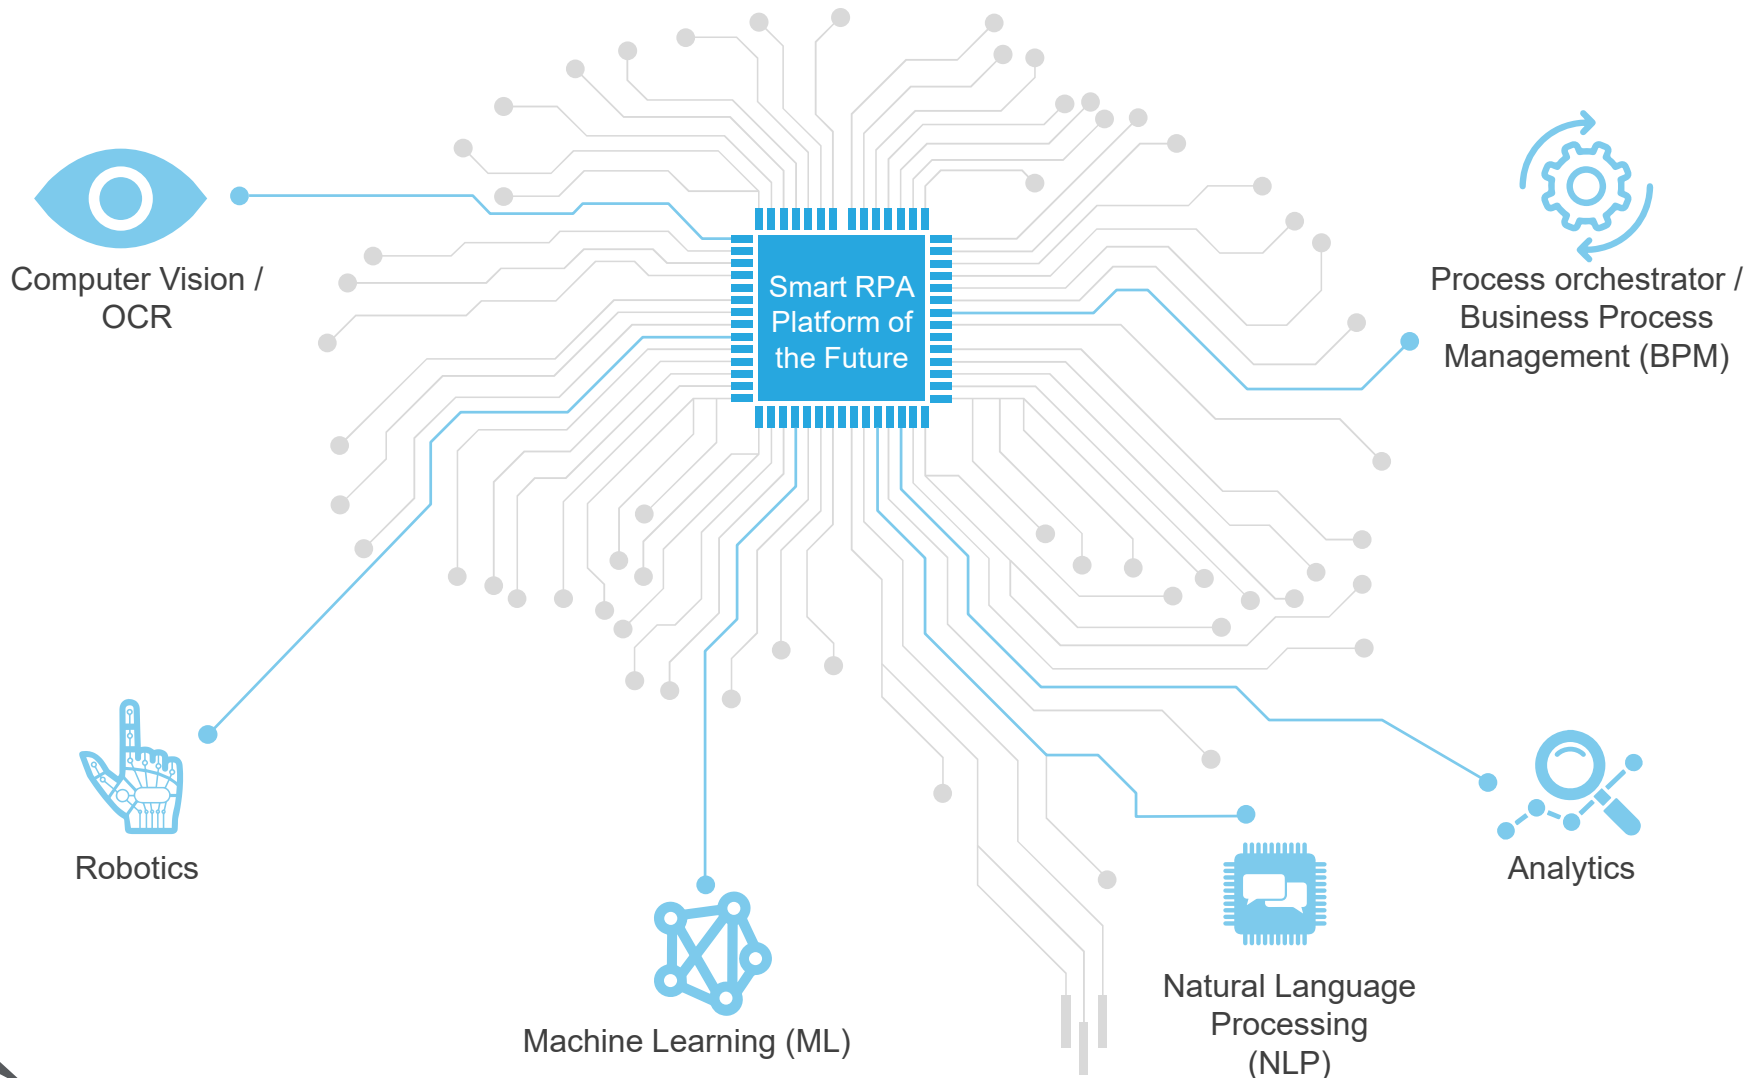

- Machine learning (ML)
- Natural Language Processing (NLP)
- Advanced analytics
- Data capture
- Automated training and self-learning
- Library of machine learning algorithms

**Key limitation:** Unable to process unstructured data

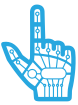

**Key solution:** Unstructured data could be in the form of live conversations or documents. The following two types of AI solutions can augment RPA by processing these types of data:

- Chatbots for live conversations
- Intelligent Document Processing (IDP) robots for documents

# RPA platforms are fast becoming the glue that brings together enterprise automation

# Key technologies that form the underlying systems for Smart RPA solutions

	Technologies	Definition	Example – billing process	Human involvement	Intelligence
	<b>Robotics</b>	<b>Robotics</b> refers to an execution engine for processing rule-based tasks	Moving customer data across disparate systems during billing	High	Low
	<b>Optical Character Recognition (OCR) / computer vision</b>	<b>OCR / computer vision</b> is a tool used to extract information from images and convert them into a machine-readable format. It utilizes descriptions, tagging, and domain-specific knowledge to identify and categorize content	Reading and gathering customer-entered data (structured or unstructured documents) and entering it into the pricing systems	High	Low
	<b>Process orchestrator / Business Process Management (BPM)</b>	<b>Process orchestrator / BPM</b> is a set of workflow and process designing tools in which the business logic for optimized processes can be configured. It governs the process flow and routes work to the best worker (human or robot) based on the nature, type, and criticality of the task	Used during a billing cycle to orchestrate the flow of work across human, robot, and system to enable end-to-end automation	High	Low
	<b>Analytics</b>	A suite of applications from worker performance analytics and process/business intelligence to diverse advanced analytics solutions such as predictive, prescriptive, and big data analytics	Automation solutions with embedded analytics could allow the company to describe, predict, and derive actionable insights for product pricing	High	Low
	<b>Machine Learning (ML)</b>	<b>ML</b> is a core technology within cognitive automation. It is a vital capability needed to automate knowledge-based business processes	As humans handle exceptions during billing, models learn and adapt, which further reduces manual effort	High	Low
	<b>Natural Language Processing (NLP)</b>	<b>NLP</b> is used to build software robots that can parse or interpret natural human language and script responses to their queries in natural language	Answering FAQs related to bills generated in interactive chat	High	Low

# It helps to visualize how Smart RPA technologies can work in your organization. They can come together to create enhanced capability for your workforce and ...

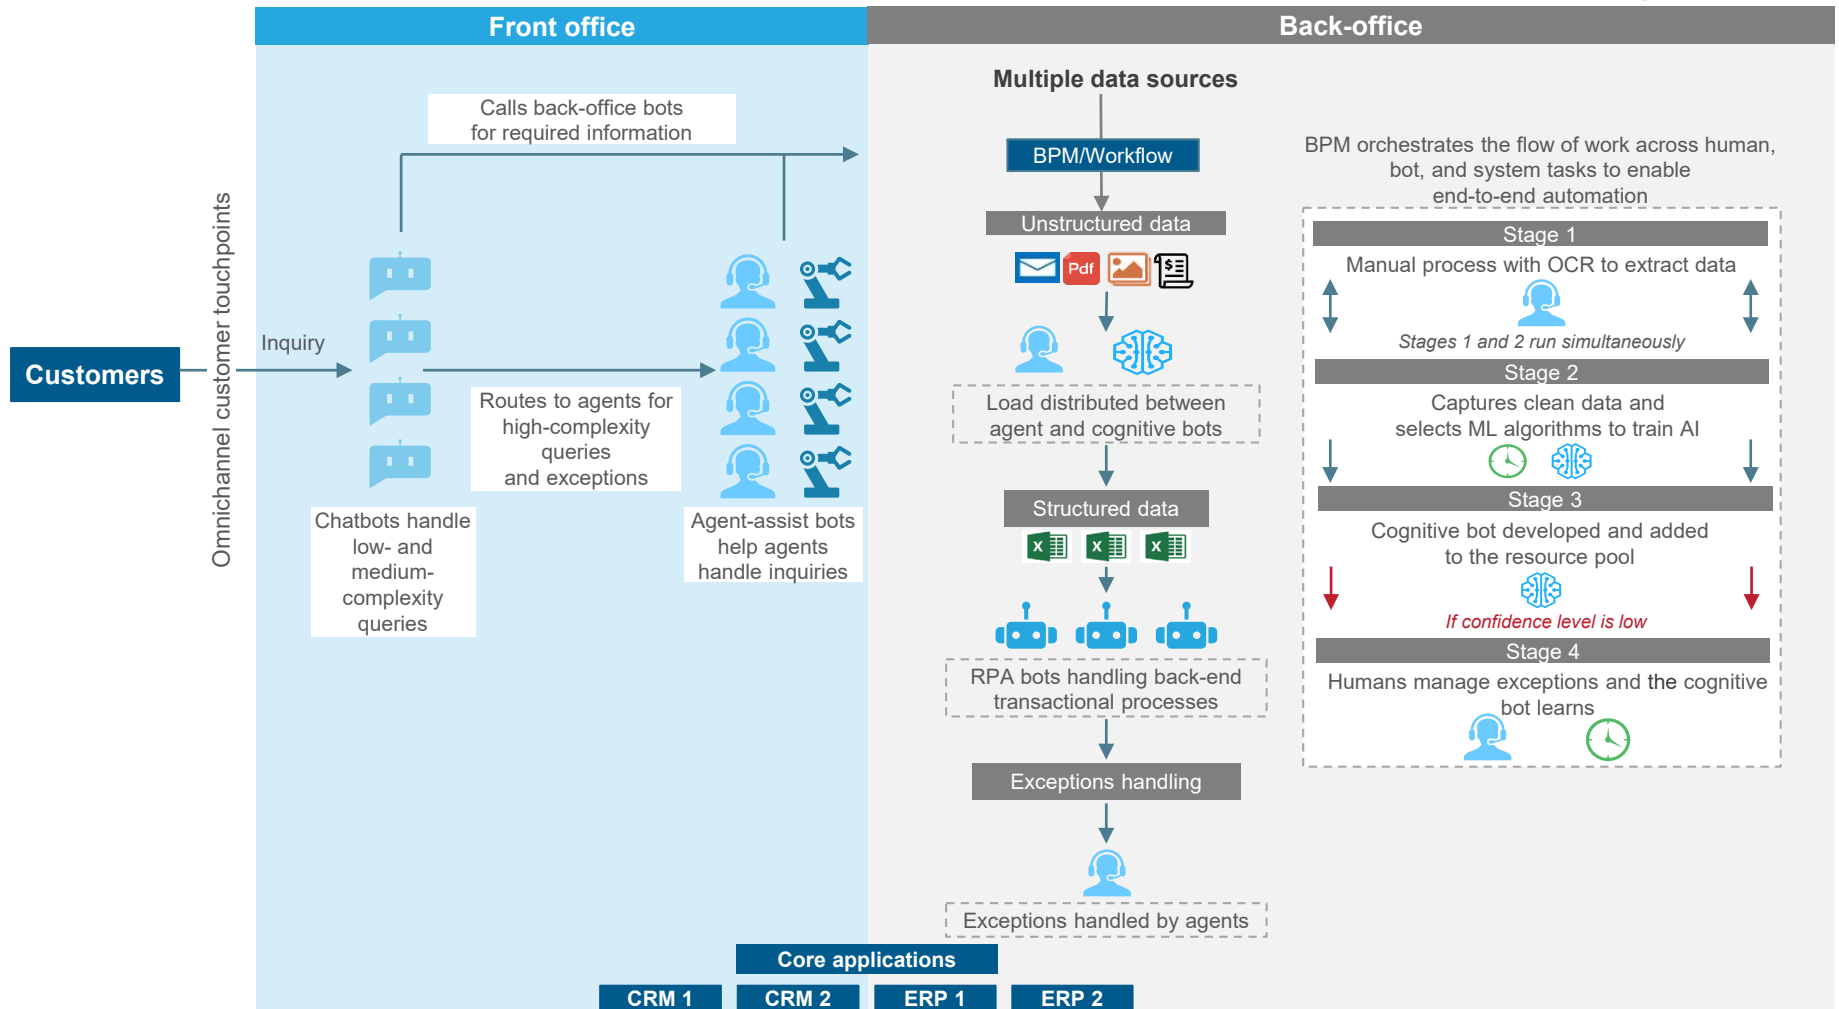

*ILLUSTRATIVE*

Use case	Next-generation workforce*				Activity	Technologies
Customer service	 Human agent	 Chatbot	 Agent-assist robot		<ul style="list-style-type: none"><li>Low-complexity inquiries are deflected through self-service channels to chatbots that interact directly with customers</li><li>Complex queries and exceptions are routed to human agents</li><li>Agent-assist robots help human agents to solve queries quickly and accurately</li></ul>	ML, NLP, Robotics, Process orchestrator
Data capture and extraction	 Human agent	 Chatbot	 RPA robot	 IDP	<ul style="list-style-type: none"><li>Data is captured in all forms (both structured and unstructured) such as speech, text, or images</li><li>Relevant information is extracted from the captured data and further enriched</li></ul>	Robotics, OCR / computer vision, NLP, ML, Process orchestrator
Data validation	 Human agent	 Chatbot	 Intelligent Document Processing (IDP)		<ul style="list-style-type: none"><li>Data validation is done primarily by a human agent to take care of all the checkpoints and raise a flag in the event of discrepancies</li><li>An IDP robot or chatbot learns through the actions of a human agent</li></ul>	ML, NLP, Robotics, Process orchestrator
Data transfer (transactional processing)	 Human agent	 RPA robot			<ul style="list-style-type: none"><li>Structured data is transferred across disparate systems through RPA robots</li><li>The process includes various operations such as copy-paste, reconciliation, and sorting</li></ul>	Robotics, Process orchestrator
Reporting	 Insights robot				Data is analyzed using business intelligence for diverse advanced analytics solutions such as predictive, prescriptive, and big data analytics, and useful insights are reported	Robotics, Analytics, ML, Process orchestrator

\* Some RPA products include many of the above natively built-in or through integration

# ...enable digital transformation of front- and back-office operations

 Learning process

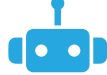

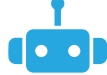

# Next-generation workforce example 1: Developing digital capabilities for customer onboarding in a telecom enterprise

Steps for execution	Description	Next-generation workforce
<b>Understand customers' requirements and capture relevant information</b>	<ul style="list-style-type: none"> <li>• Chatbots interact with customers in natural language to understand the intent and capture required information</li> <li>• Exceptions are routed to human agents, and the chatbots learn by observing human actions</li> <li>• Agent-assist robots suggest several possible packages/solutions based on previous customer interactions. The human agent is able to make a decision more quickly using these suggestions</li> </ul>	 Human agent  Chatbot  Agent-assist robots
<b>Fill in forms and walk through external links</b>	<ul style="list-style-type: none"> <li>• A chatbot interacts with the customer to get additional information and passes on relevant information to the RPA robot</li> <li>• An RPA robot enriches the passed-on information using external websites and tools to complete the application form</li> <li>• The RPA robot saves application with a pre-defined naming convention</li> </ul>	 RPA robot  Chatbot
<b>Validation of identity documents</b>	<ul style="list-style-type: none"> <li>• Data entry is validated against supporting documents and discrepancies are flagged automatically for review</li> <li>• This process also can aid in fraud detection and malware handling</li> </ul>	 IDP  Human agent
<b>Uploading data into backend enterprise application to create a unique ID</b>	<ul style="list-style-type: none"> <li>• The RPA robot runs the new entry data through various back-end systems to generate a unique customer ID and populate the details for the next billing cycle</li> </ul>	 RPA robot
<b>Spreadsheet population and data manipulation; Sending confirmation mail</b>	<ul style="list-style-type: none"> <li>• The RPA robot manipulates data and makes entries into a pre-defined template, including tentative bill calculations based on the selected plan</li> <li>• The RPA robot sends the customer a confirmation email</li> </ul>	 RPA robot

## Next-generation workforce example 2: Developing digital HR assistant capabilities

Steps for execution	Description	Next-generation workforce
<b>Understanding user intent/requirements</b>	<ul style="list-style-type: none"> <li>Chatbots interact with users in natural language to understand the intent and capture required information</li> <li>Exceptions are routed to human agents, and the chatbots learn by collecting exception handling data and training its learning model</li> </ul>	 Chatbot  Human agent
<b>Interacting with the HR system to execute users' requests</b>	<ul style="list-style-type: none"> <li>An RPA robot receives relevant information from the chatbots and interacts with the enterprise HR system to execute the associated workflow to process user requests such as getting leave balances, applying for leave, getting specific documents such as performance reviews, travel claim applications, and medical claim applications, or filing a claim</li> </ul>	 RPA robot
<b>Extracting relevant information from claim forms</b>	<ul style="list-style-type: none"> <li>For claim requests, the RPA robot extracts relevant information from the claim forms provided by users and makes the relevant data entry in the HR system</li> <li>For semi-structured or unstructured documents, the RPA robot integrates with Intelligent Document Processing (IDP) to extract the relevant information</li> </ul>	 RPA robot  IDP
<b>Validating documents in support of claims</b>	<ul style="list-style-type: none"> <li>The RPA robot integrates with IDP to validate the entry made in the HR system against the supporting documents and automatically flags any discrepancy for review</li> <li>Human agents handle exceptions</li> </ul>	 RPA robot  IDP  Human agent
<b>Updating the status of requests to users and / or sending confirmation emails</b>	<ul style="list-style-type: none"> <li>A chatbot collects relevant information from the RPA robots and updates users with the status of their requests</li> <li>RPA robots send confirmation emails to the users</li> </ul>	 RPA robot  Chatbot

# Enterprises have been able to achieve significant benefits from their Smart RPA investments

About 20% of enterprises that have deployed RPA have implemented AI in conjunction with their RPA deployments<sup>1</sup> and the number is rising

Enterprises, on average, **achieved 30-40%** improvement in **operational metrics** such as process accuracy, cycle time, staff productivity, and SLA compliance from RPA/AI

Enterprises, on average, achieved a **ROI** from RPA/AI investments within the first 12 months

**Faster** implementation time and time-to-value realization with RPA than other comparable solutions such as Enterprise Application Integration (EAI) or BPMS tools

**More than 50%** of enterprises that adopted RPA/AI indicated high to very high impact on improving **customer experience**

**More than 20%** of enterprises achieved **revenue growth** from their RPA/AI deployments; this result is indicative of a relatively lower level of adoption maturity in the market

Enterprises, on average, have achieved **30% cost savings** from RPA/AI

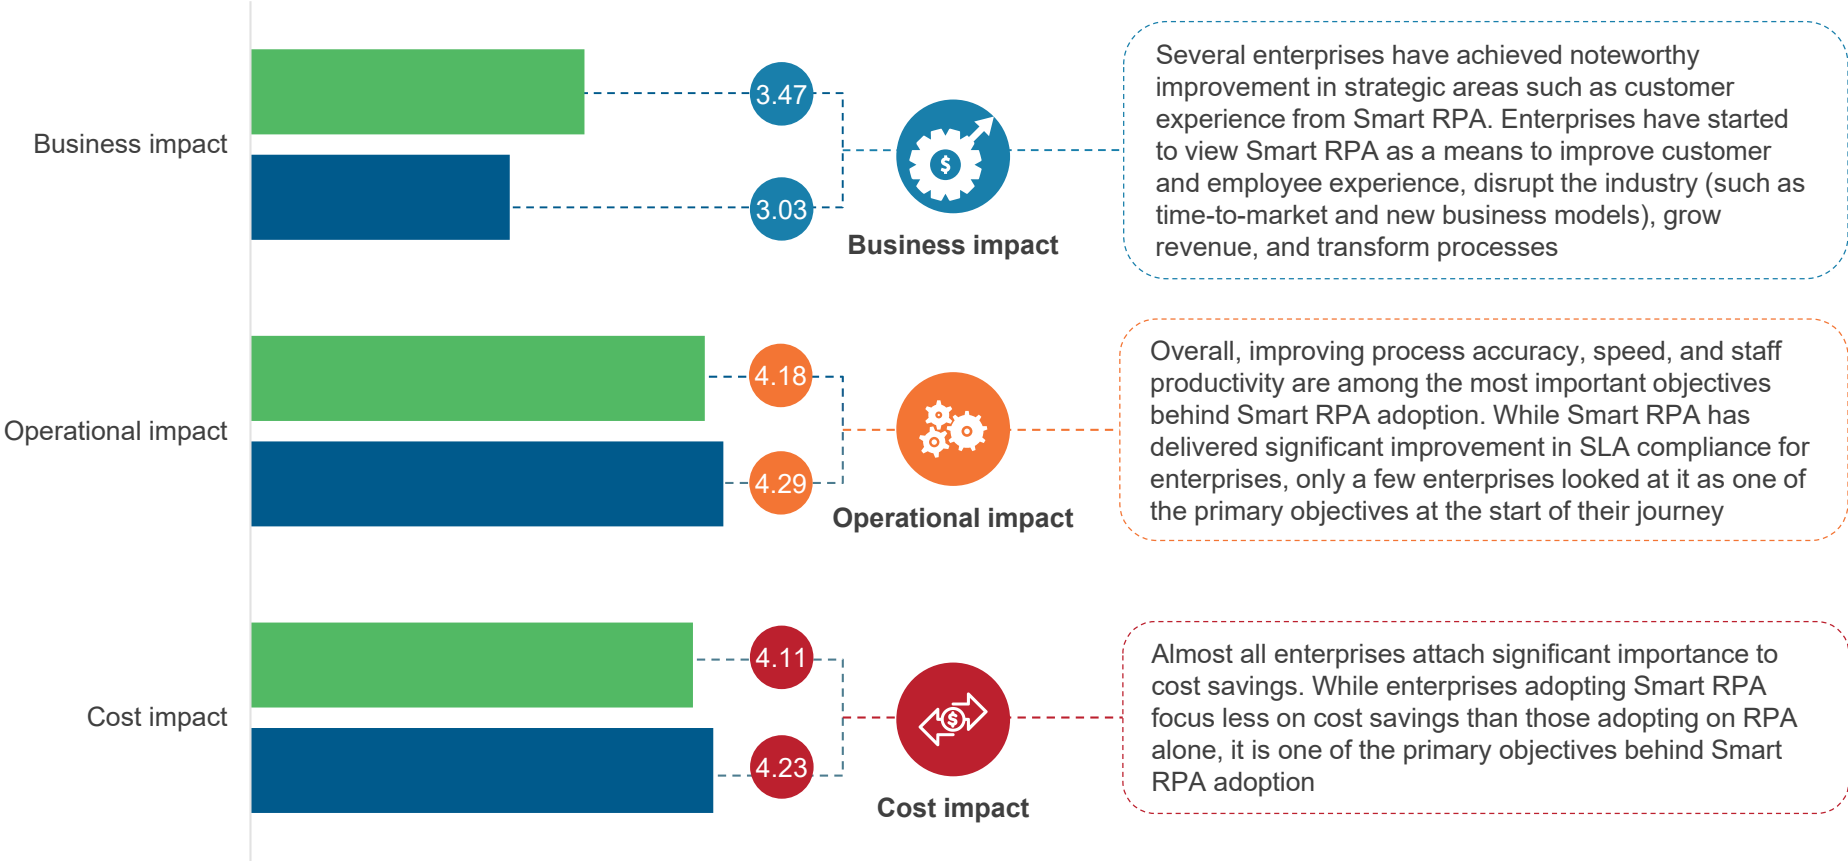

<sup>1</sup> Based on responses of 52 enterprises that have deployed RPA

# Enterprises adopting Smart RPA are placing more emphasis on strategic impact drivers than those that are adopting on RPA alone

**Key factors driving adoption**  
Importance on a scale of 1 to 5; 2017

Scale: Not important ← 1 5 → Significantly important

Smart RPA (RPA+AI) RPA

# Adoption of Smart RPA is not without challenges but they can be overcome (page 1 of 2)

	Challenges 	Best practices / lessons learned 
Process selection	<ul style="list-style-type: none"><li>• Difficult to automate higher-level processes</li><li>• Lack of process standardization adding to cost and lowering Smart RPA returns</li></ul>	<ul style="list-style-type: none"><li>• Starting out with a happy path instead of trying to automate processes end-to-end</li><li>• Integrating with BPM / process orchestrator</li><li>• Looking into process standardization and optimization before automating</li></ul>
Availability of relevant and sufficient talent	<ul style="list-style-type: none"><li>• Shortage of skills to develop, manage, and run Smart RPA solutions</li><li>• Lack of practical knowledge to implement AI tools and technologies</li></ul>	<ul style="list-style-type: none"><li>• Vendors are boosting training and education programs</li><li>• Enterprises should take input from third-party service providers to help with initial deployment and training of in-house resources</li></ul>
Organizational readiness	<ul style="list-style-type: none"><li>• Organizational change resulting from Smart RPA, i.e., change in delivery model, processes, etc.</li><li>• Stakeholder buy-in</li><li>• Concerns from IT teams</li></ul>	<ul style="list-style-type: none"><li>• Smart RPA implementations should be treated as change programs and managed using best practice change management methodologies, establishing a CoE, and partnering with enterprise IT</li></ul>

# Adoption of Smart RPA is not without challenges but they can be overcome (page 2 of 2)

	Challenges 	Best practices / lessons learned 
Lack of sufficient data to train AI	<ul style="list-style-type: none"><li>• It often takes huge volumes of clean data to train AI to attain required accuracy levels</li><li>• Extracting this data and making it relevant for training purposes is a task in itself, which hampers smooth adoption of AI</li></ul>	<ul style="list-style-type: none"><li>• One approach is to use past transactions' information or data, anonymize if necessary, and quality check for AI-based automation training</li><li>• Making the right process choices for AI automation can get the company off to a good start on the learning curve</li></ul>
Transparency in AI decision-making	<ul style="list-style-type: none"><li>• Ethics and transparency are key concerns in AI adoption</li><li>• Determining or tracking the path taken by AI software to make some decisions can be difficult</li></ul>	<ul style="list-style-type: none"><li>• Organizations with concerns over ethics, accuracy, and correctness of AI tend to use supervised learning that always involves a human working with AI</li></ul>
Implementation	<ul style="list-style-type: none"><li>• Scaling up Smart RPA takes longer than expected</li><li>• Business people lacking Smart RPA programming skills and Smart RPA developers lacking business context</li></ul>	<ul style="list-style-type: none"><li>• Managing expectations around time and effort required to create impact</li><li>• Enabling the right environment (such as a CoE) for business SMEs to efficiently work with the development team</li></ul>

# Key content

---

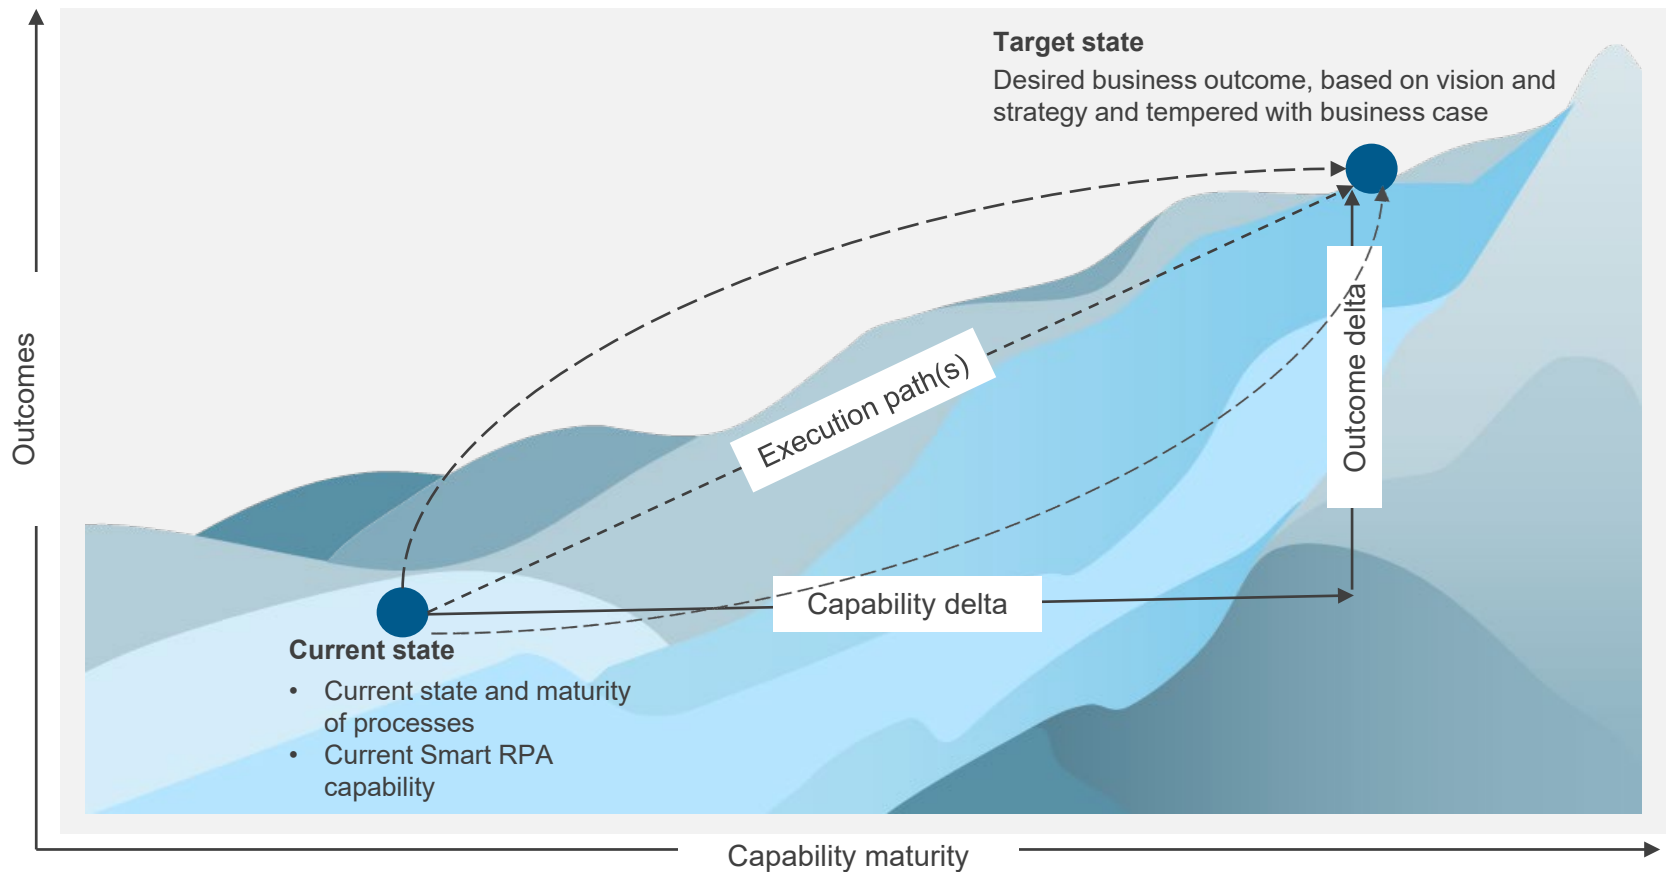

- Introduction to Smart RPA
- **Enterprise Smart RPA journey**
- Accelerating the Smart RPA journey
- Enterprise case studies
- Pinnacle Enterprises™ Smart RPA maturity model
- Developing the business case for Smart RPA
- Appendix

# Enterprises can break down their Smart RPA journeys into five distinct steps

# It is important for enterprises to understand their current and desired target states to map a best-fit execution path

STEP 1

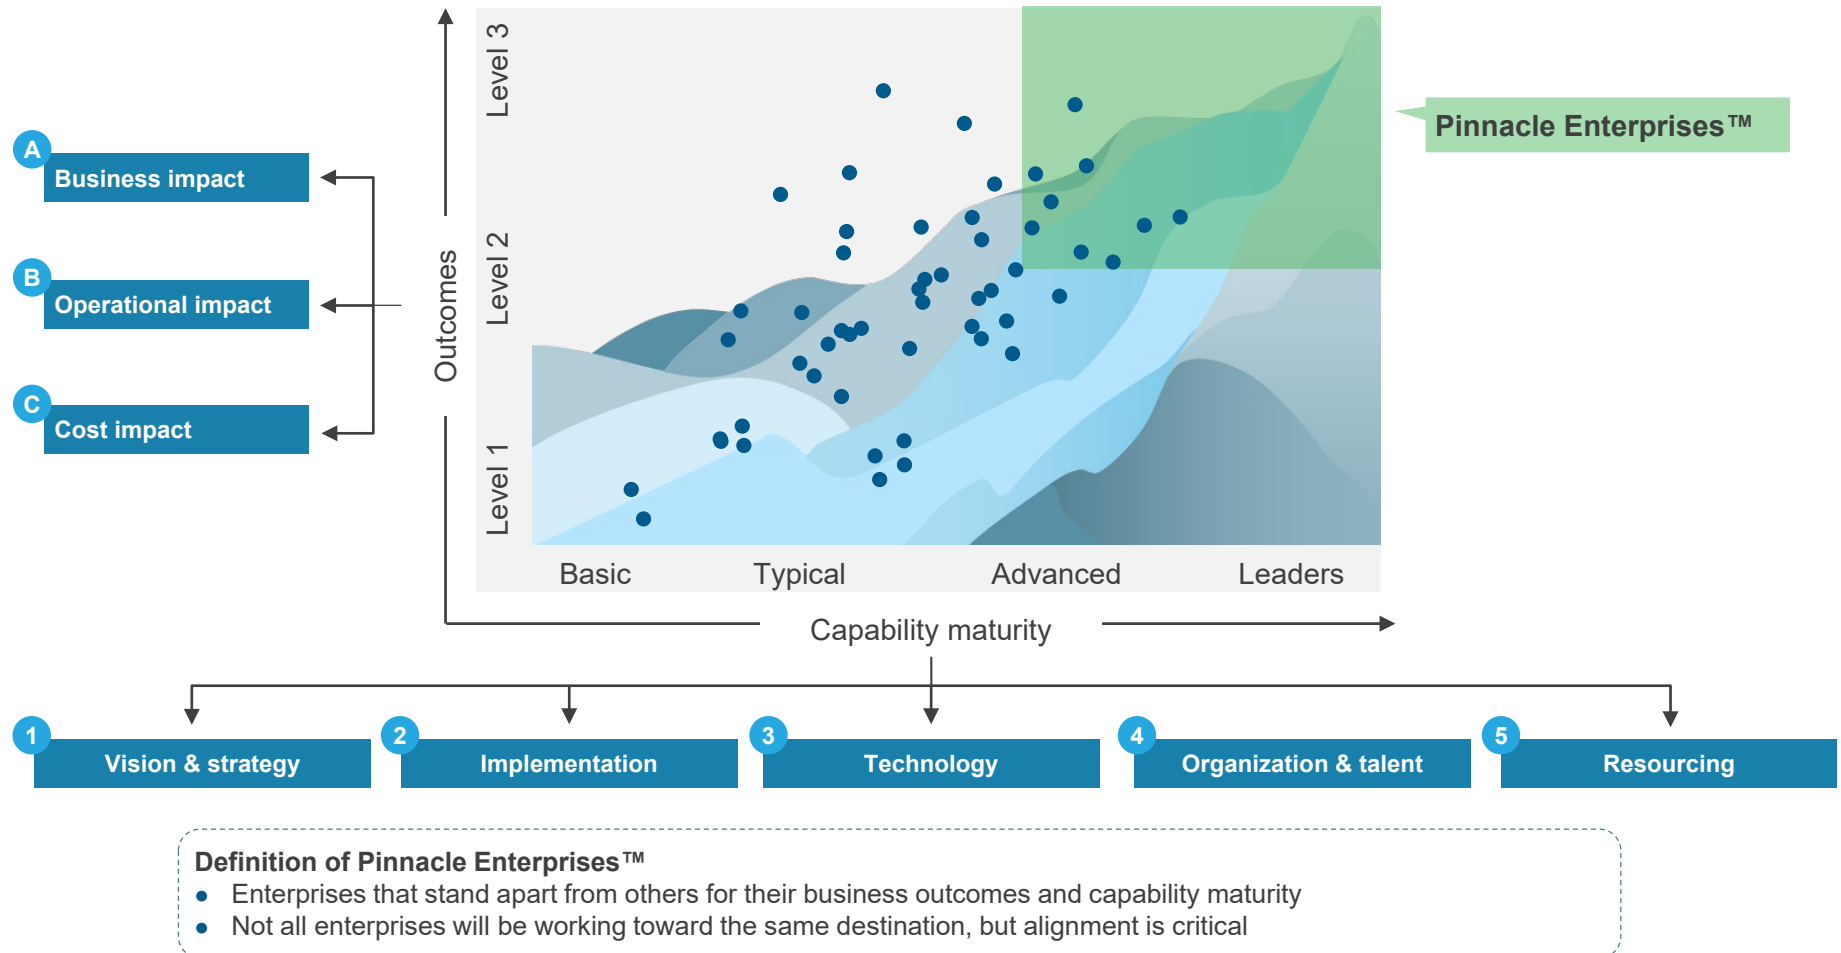

- The automation journey for every organization begins with an understanding of its current state of maturity and its aspirational target state
- While the start and target states outline the gaps to be bridged, the actual execution path to be followed to bridge those gaps will depend on multiple factors, as described in subsequent pages

# The Pinnacle Model™ provides a framework to help enterprises measure Smart RPA journey current and target states, both in terms of outcomes and capabilities

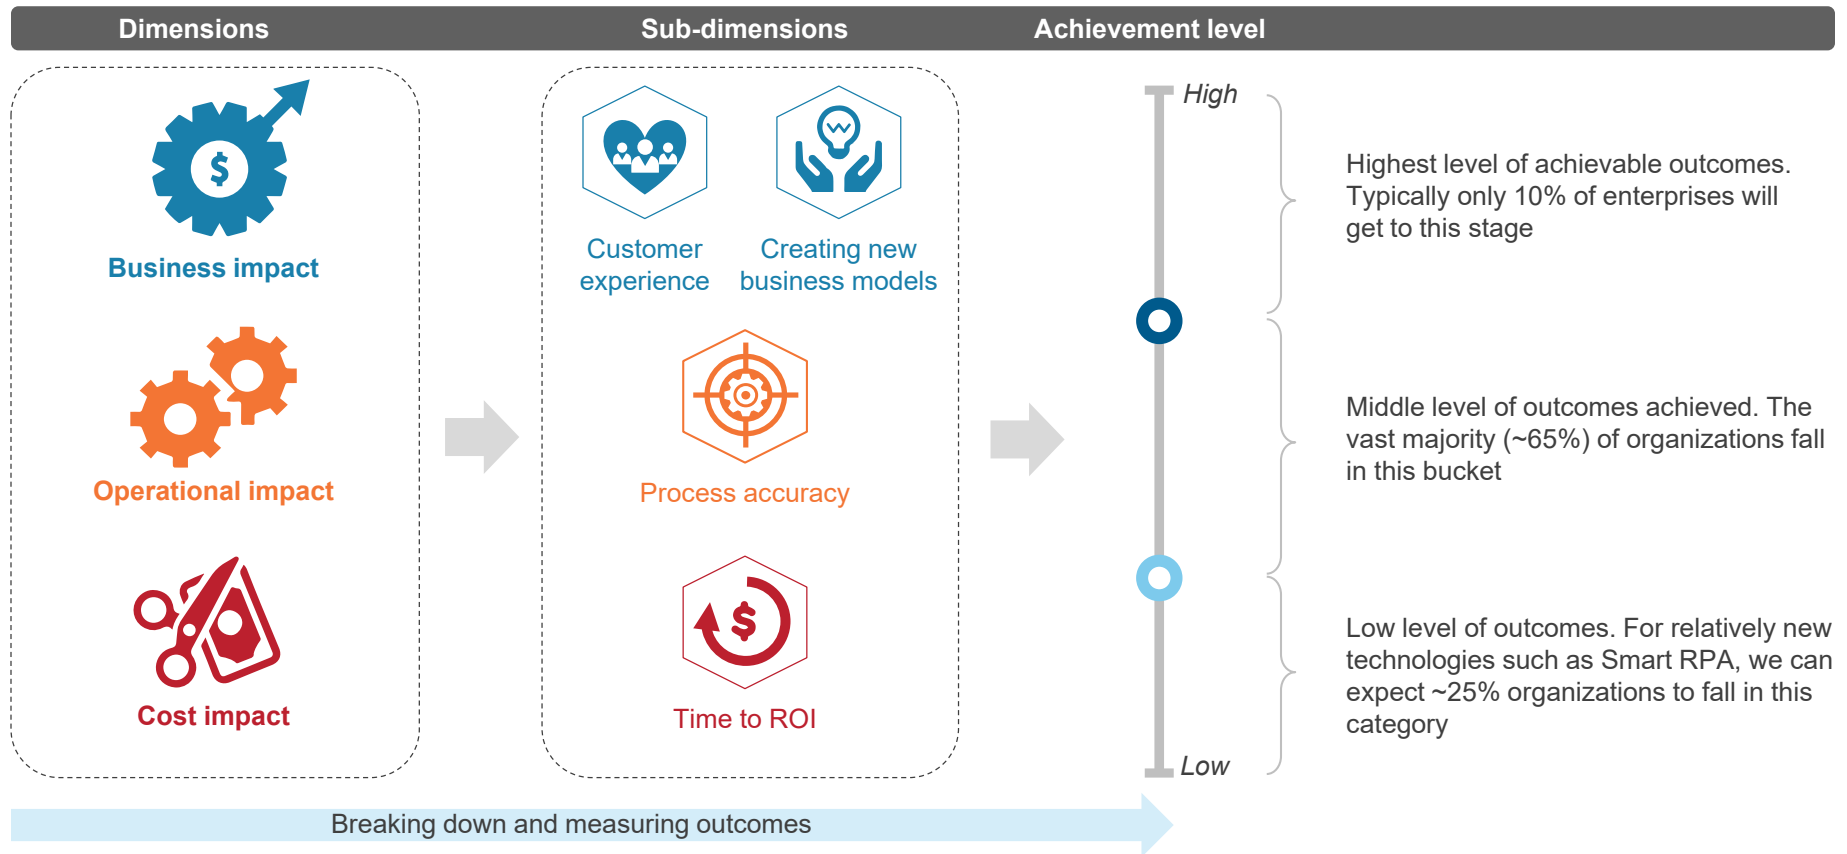

STEP 1

Everest Group Pinnacle Model™ Analysis 2018 for mapping an enterprise journey to become a Pinnacle Enterprise™

# Outcomes: Use the Pinnacle Enterprise™ outcomes model to understand your current state and goals for the desired target state

## STEP 1

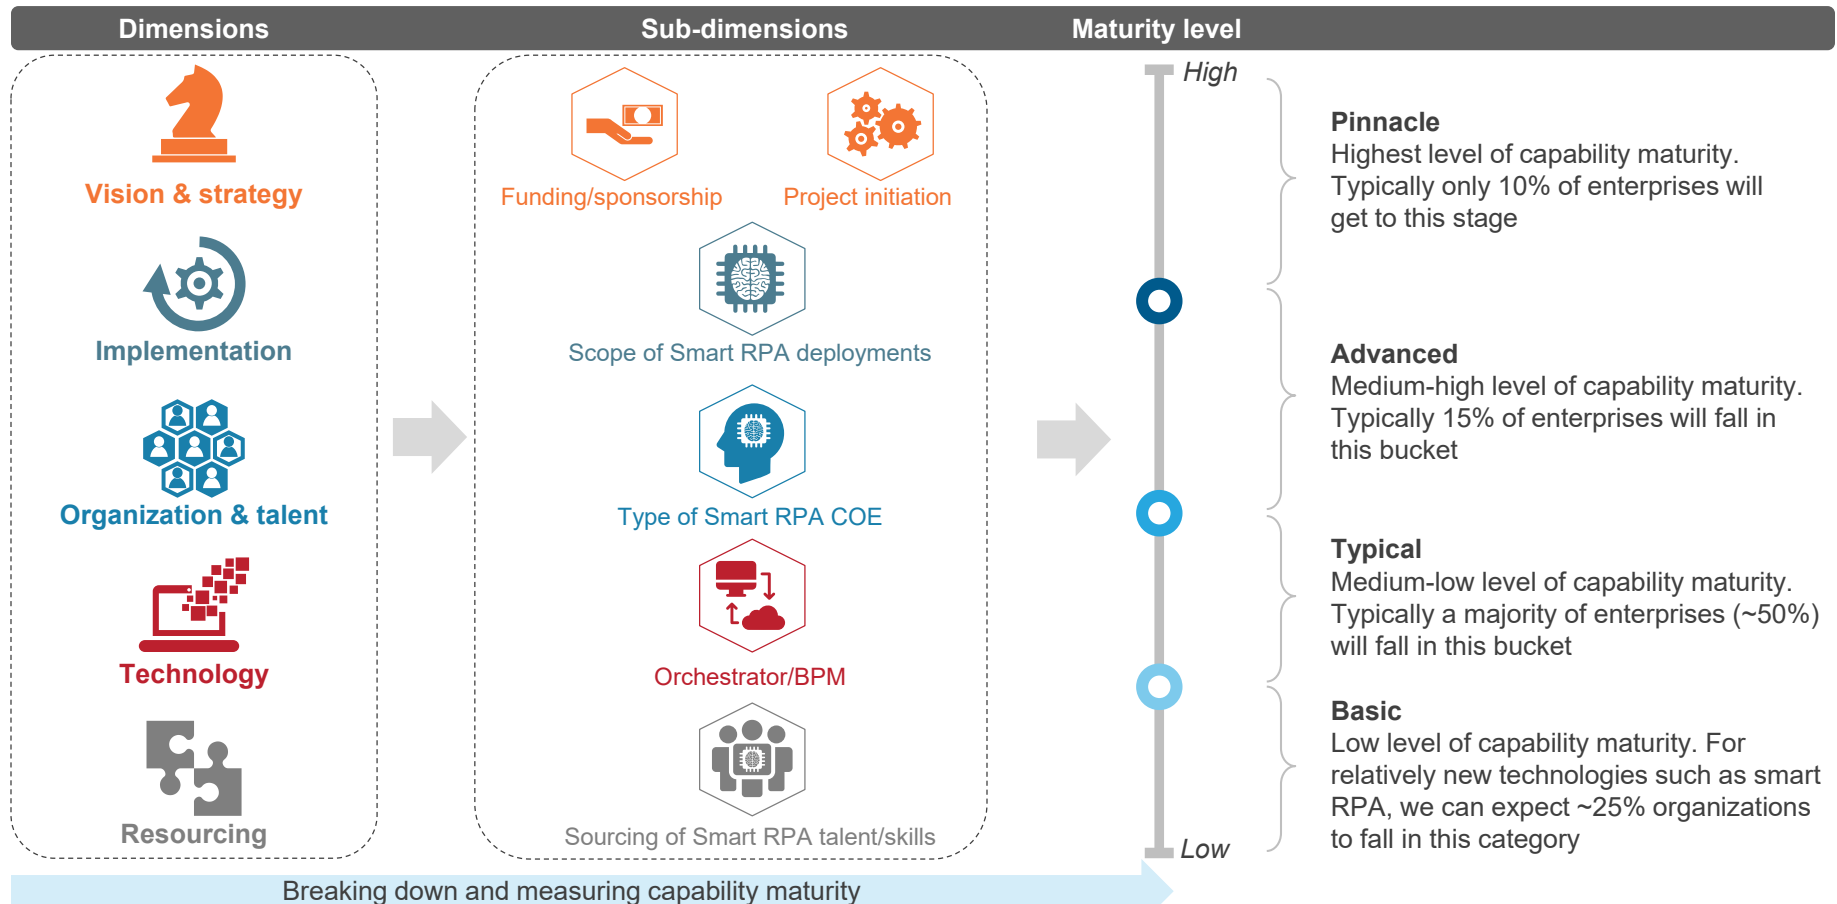

- Overall, outcome is measured through a combination of three factors: cost impact, operational impact, and business impact
- Each of these are further broken down into sub-dimensions that fall into one of three buckets depending on the level of outcome achieved. The exact measure of outcomes will vary significantly by the portfolio of processes being automated

1 Refer to pages 106-132 for the detailed model, dimensions, and sub-dimensions

# Capability: The Pinnacle Enterprises™ Capability Maturity Model (CMM)<sup>1</sup> can help enterprises understand their current state of capabilities and subsequently where they want to get to

STEP 1

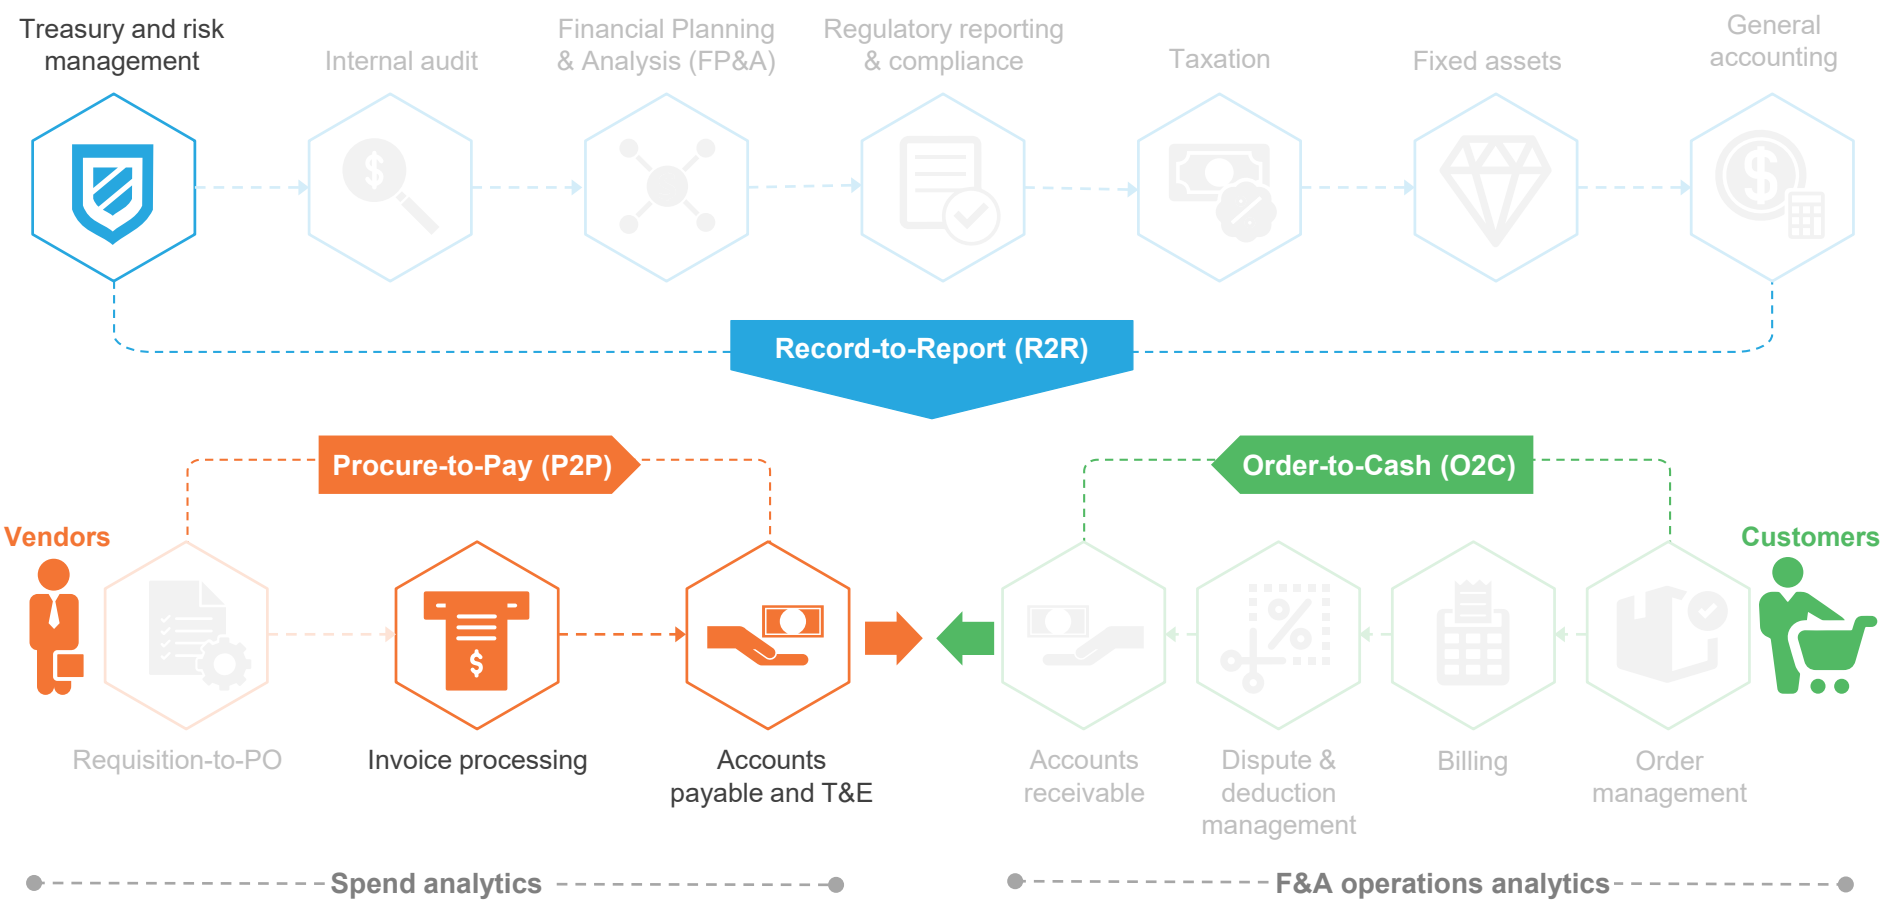

- Overall, capability is measured through a combination of 5 factors - vision & strategy, implementation, organization and talent, technology, and resourcing
- Each of these is further broken down into sub-dimensions which can be measured as falling in one of four buckets depending on the maturity level: basic, typical, advanced and pinnacle

<sup>1</sup> Refer to pages 106-132 for the detailed model, dimensions, and sub-dimensions

# Illustration: Consider an organization evaluating its Finance & Accounting (F&A) business function for automation, and a selection of processes in particular ...

STEP 1

## Finance and Accounting (F&A) value chain

# ... AP, treasury and risk management, and management reporting and analysis; when evaluating sub-processes for automation ...

STEP 1

## Detailed description of processes within F&A

### Capital budgeting

- Strategy
- Administer approval process
- Project reporting

### Management reporting and analysis

- Strategy
- Regular reporting
- Data extraction
- Analysis
  - Ad hoc analysis and special projects
  - Cost accounting

### Regulatory reporting and compliance

- Strategy
- Data extraction
- Management Discussion & Analysis (MD&A)
- Regulatory reporting
- Compliance program

### Tax

- Strategy
- Tax accounting
- Tax planning and analysis
- Tax compliance
- Tax audit

### Accounts receivable

- Strategy
- Customer set up
- Billing
- Cash applications
- Credit and collections
- Customer inquiries
- Reporting

### General accounting

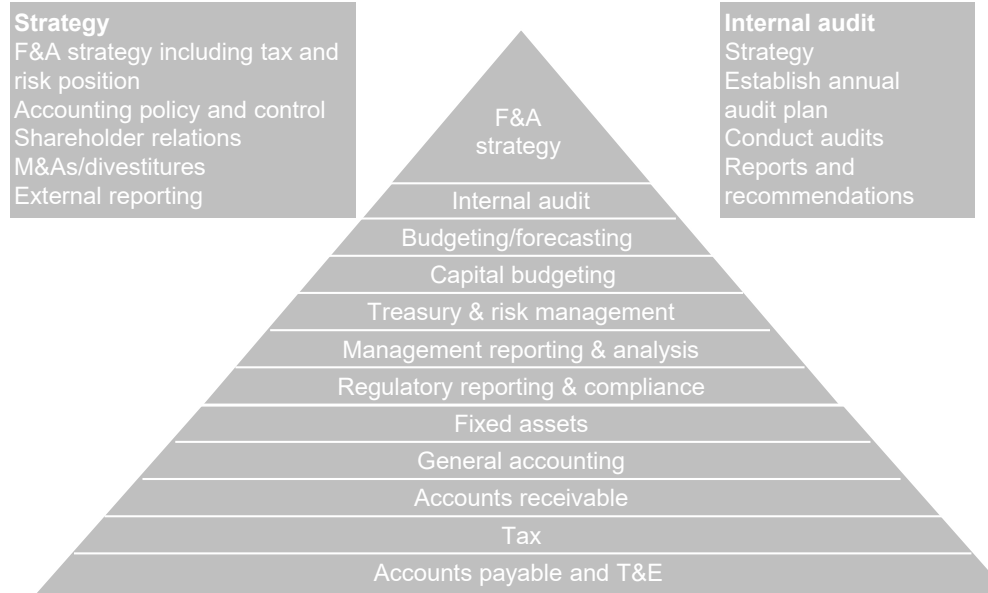

- Strategy
- Process general entries
- Account reconciliations
- Inter-company accounting
- Prepare trial balances
- Perform closings
- Manage consolidations
- Cost accounting

### Fixed assets

- Maintain master data
- Merger, acquisition, and consolidation of assets
- Post depreciation

### Accounts payable and T&E

- Strategy
- Maintain master data
- Process payment requests
- Process T&E claims
- Administer EDI /P-card
- Month-end close
- Vendor inquiries
- Reporting

### Internal audit

- Strategy
- Establish annual audit plan
- Conduct audits
- Reports and recommendations

### Strategy

- Judgment-intensive
- Transaction-intensive

### Budgeting/forecasting

- Strategy
- Budget analysis and approval process
- Build-line item budget
- Forecast roll-ups and consolidation
- Forecast analysis and approval process

### Treasury & risk management

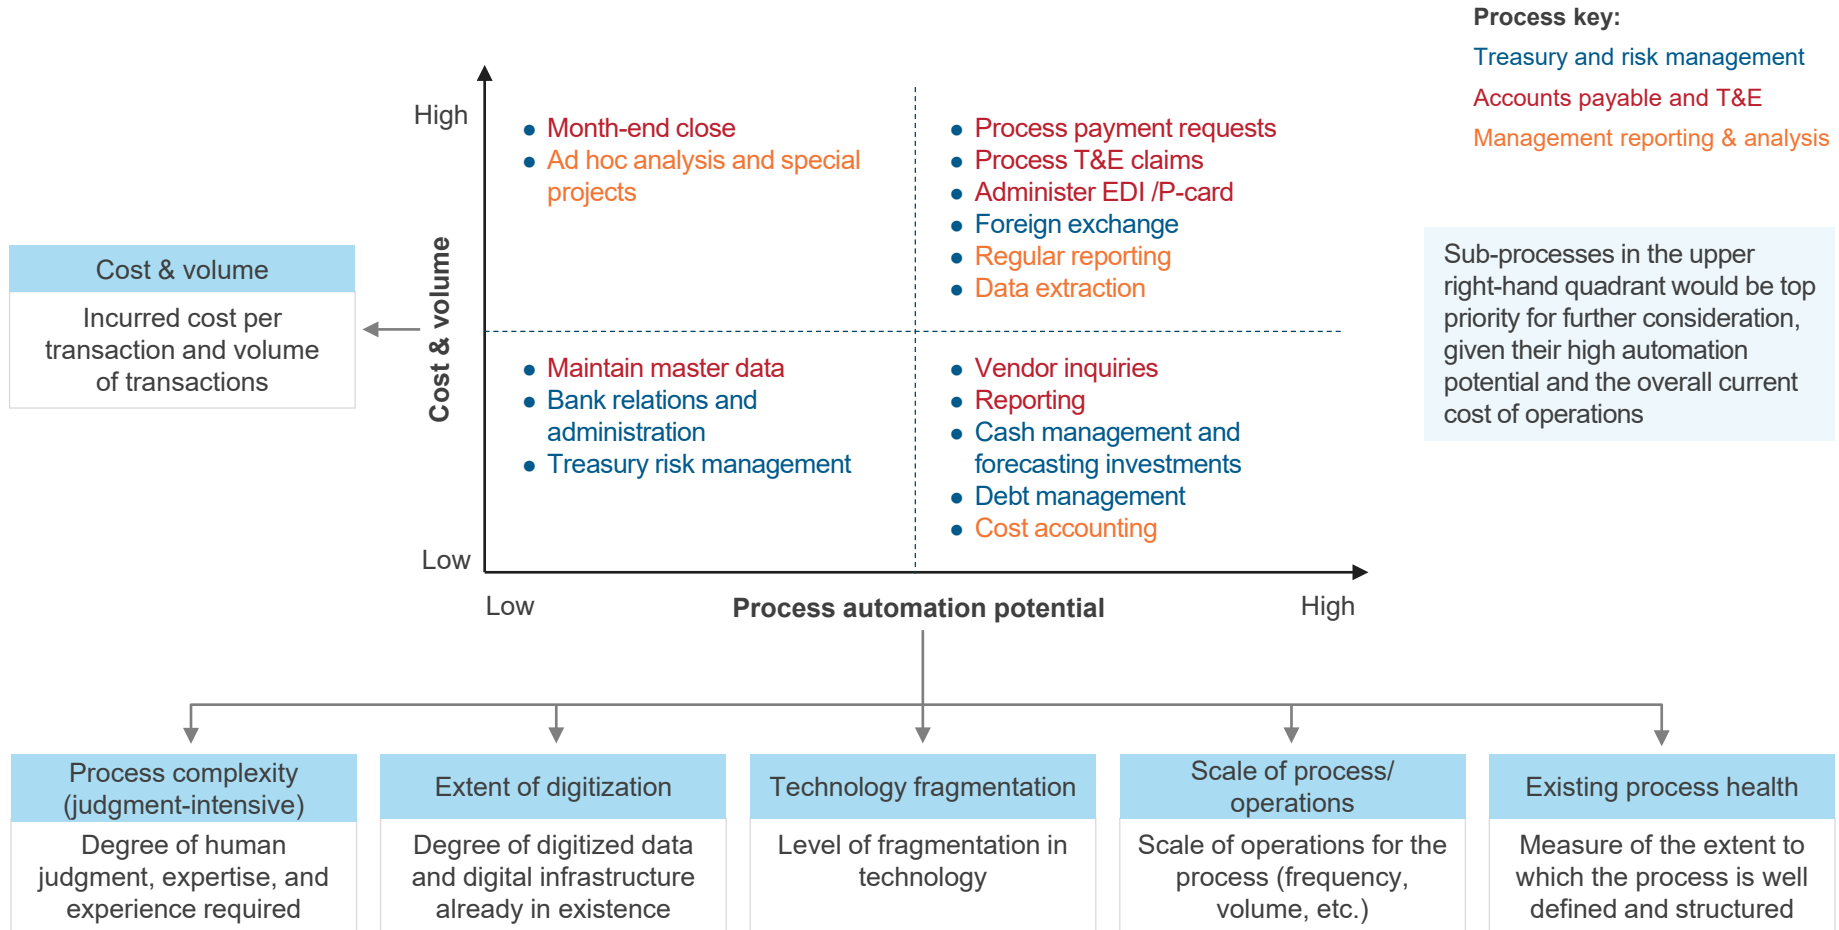

- Strategy
- Bank relations and administration
- Cash management and forecasting
- Investments
- Debt management
- Foreign exchange
- Treasury risk management

# ... processes with high running costs, a large volume of transactions, and high automation potential should be considered for further evaluation

STEP 1

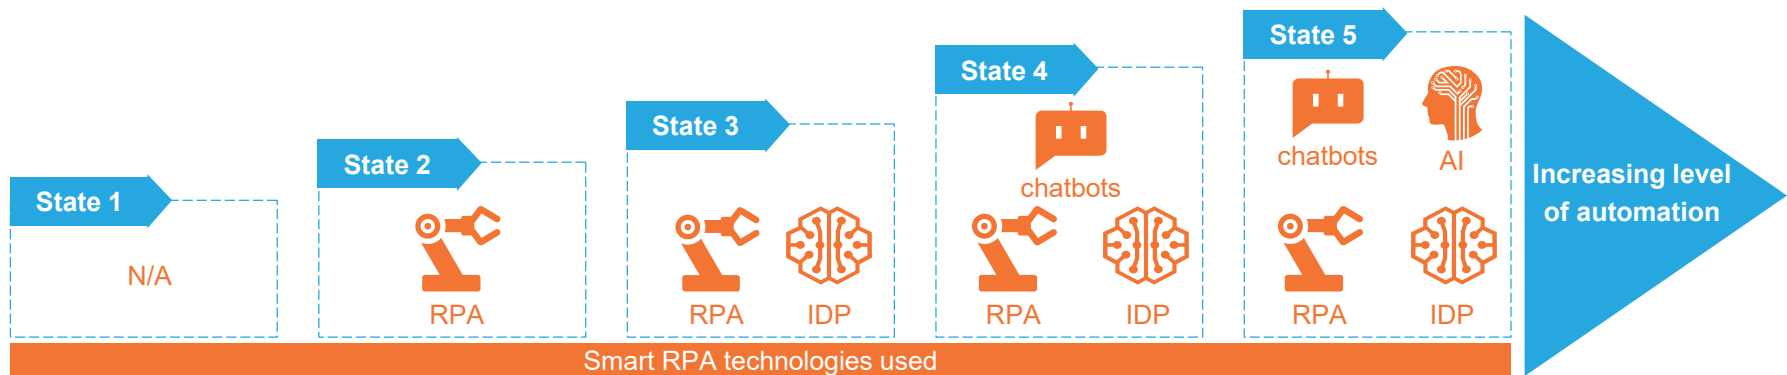

ILLUSTRATIVE

The exhibit shows a framework for assessing F&A processes for automation; this is the kind of framework organizations can use to identify and prioritize processes for business case development

# Precursor to the business case – examining the target state options and potential use cases

STEP 2

Use cases (all examples additive to previous state)				
None – business as usual	<ul style="list-style-type: none"><li>Robot(s) processing a large number of emails, monitoring the inbox 24/7. When a new email arrives, the robot downloads the invoices attached to a shared drive and adds a reference for each one to an orchestrator queue</li><li>Vendor account reconciliation</li></ul>	<p>Use of IDP to digitize and extract data from invoices.</p> <ul style="list-style-type: none"><li>Exception handling and verification through human in the loop</li></ul>	<p>Chatbots to handle basic vendor inquiries and create tickets and/or transition to live agents when required</p>	<p>Exception handling through machine learning-based algorithms. ML-based predictive analytics to provide inputs on vendor payment patterns, need for follow ups, payment terms suggestions, etc.</p>

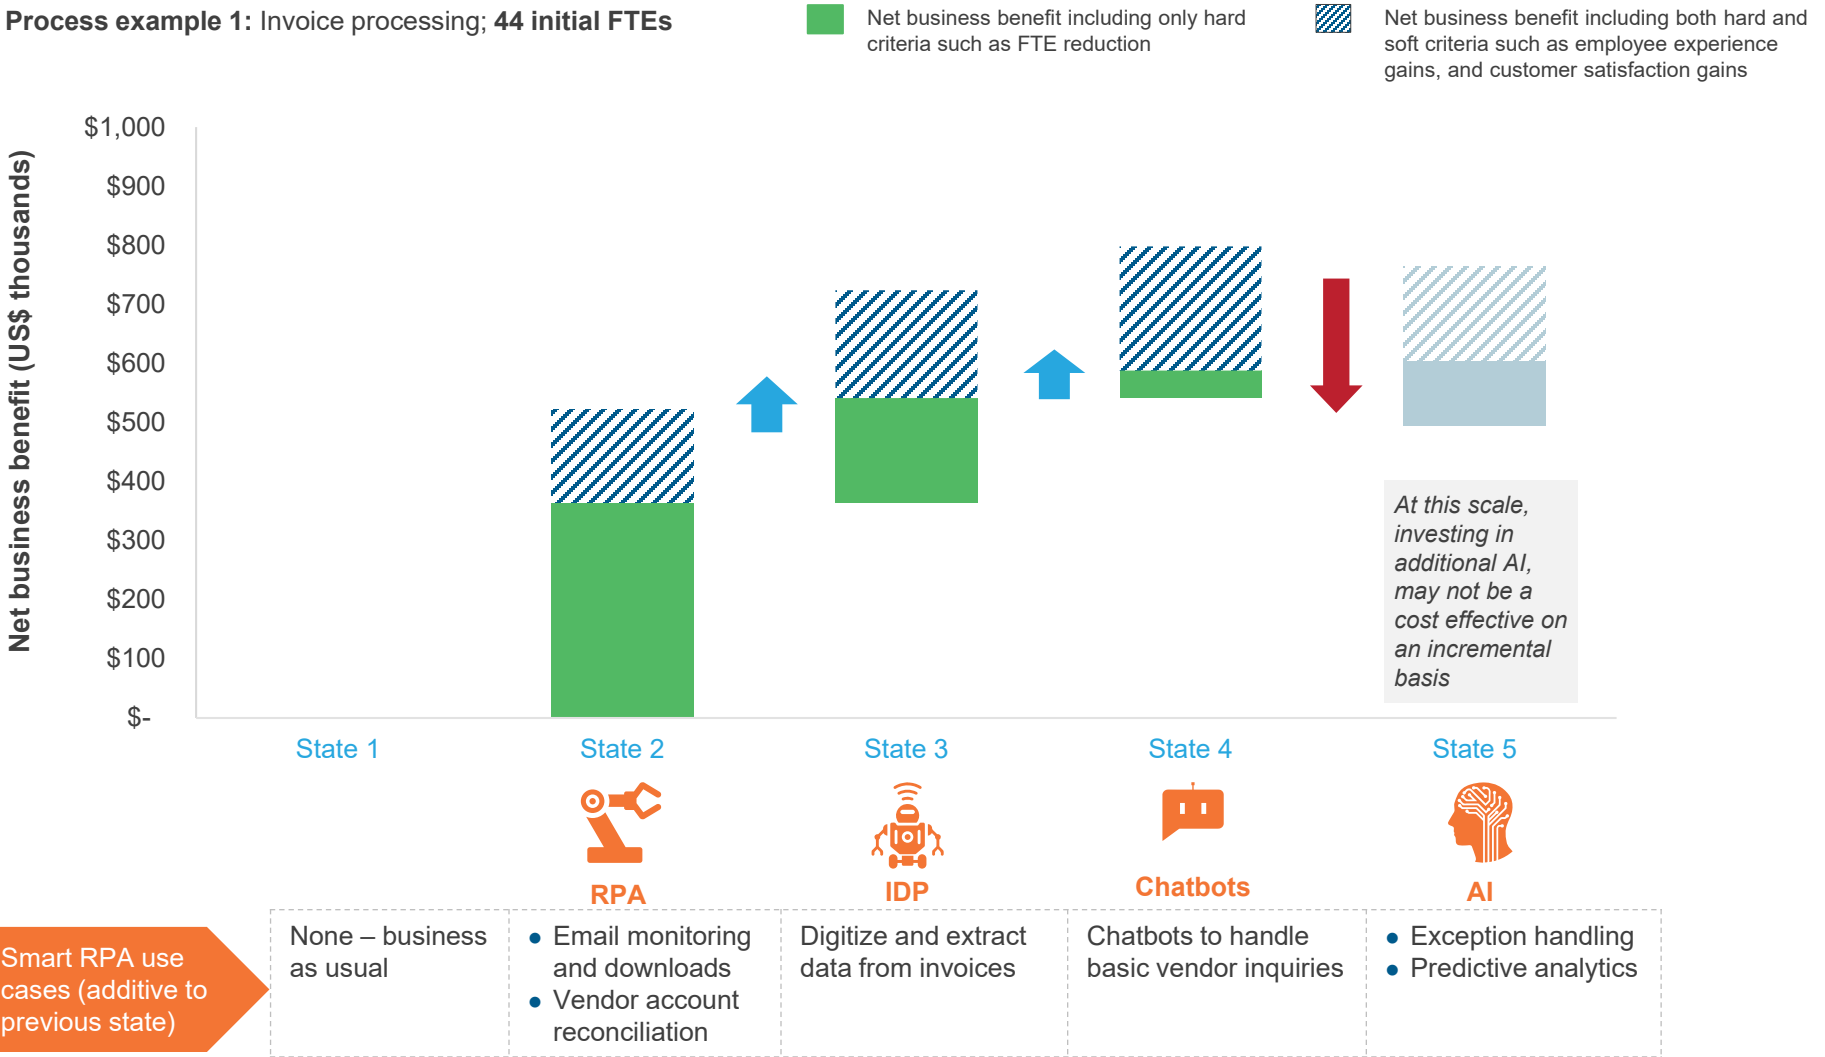

Consider the invoice processing as an example. The process consists of four tasks: invoice data extraction, invoice exception handling, vendor account reconciliation, and vendor inquiry. With increasing sophistication of Smart RPA technologies, larger parts of the process can be automated

# Building a business case – what is the right outcome target state?

Numerous automation options can be included with Smart RPA; the key is to fully understand all of the available components against the likelihood of diminishing returns

STEP 2

Process example 1: Invoice processing; 44 initial FTEs

# Building a business case – what is the right outcome target state?

Numerous automation options can be included with Smart RPA; the key is to fully understand all of the available components against the likelihood of diminishing returns

STEP 2

Process example 2: Invoice processing; 186 initial FTEs

# Having determined an achievable outcome, enterprises should then seek to map out corresponding capability requirements to achieve the desired outcome

STEP 3

Mapping capabilities required to support outcomes – extract<sup>1</sup>

ILLUSTRATIVE

  Required maturity level

Enterprise Smart RPA Capability Maturity Model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
C. Technology	OCR / Computer vision	Basic OCR for digitizing content; typed text	OCR + ML + rules; Document classification, data capture, and extraction using machine learning, template-based rules, and validation; block letters (typed or handwritten)	OCR + Auto ML + NLP; Document classification, data capture, and extraction using real-time / active learning, Auto ML, NLP, intent analysis, rules, and validation; block letters (typed or handwritten)	OCR + Domain ontology + Deep Learning + Auto ML + NLP; Document classification, data capture, and extraction using real-time / active learning, Auto ML, NLP, intent analysis, rules, and validation; cursive writing with good level of accuracy
	Analytics	Reporting analytics	Descriptive analytics + (reporting)	Predictive analytics + (reporting + descriptive)	Prescriptive analytics + (reporting + descriptive + predictive)
	Chatbots	Simple, rules-based	Rules-based + text analysis	ML + NLP + sentiment analysis + emotional analysis + next-best-action	Deep learning + Auto ML + NLP + sentiment analysis + emotional analysis + contextual and domain ontology

<sup>1</sup> Refer to pages 108-129 for the detailed Smart RPA capability maturity model

# Everest Group organizes Smart RPA capabilities according to five key components of enterprises' Smart RPA journey

STEP 3

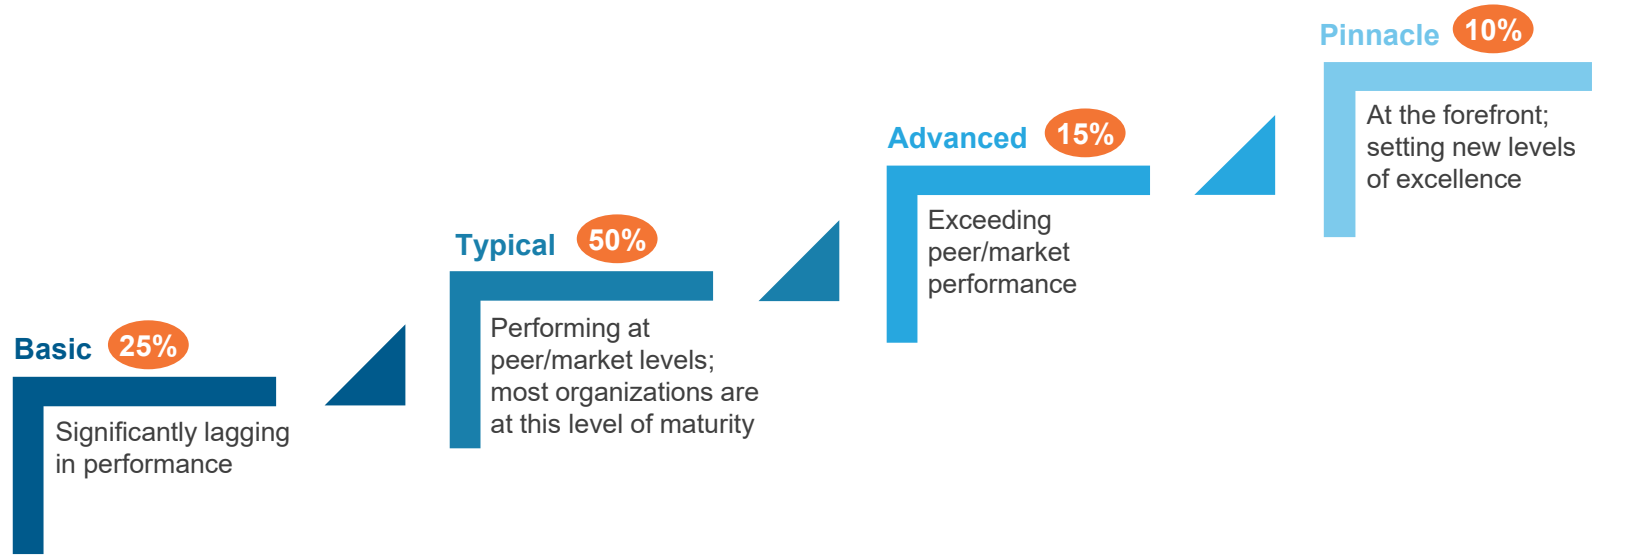

Journey components	Key focus area
 Vision & strategy	<ul style="list-style-type: none"><li>• To understand the vision of the organization for Smart RPA and the drivers behind its adoption</li><li>• To assess the organization's readiness for Smart RPA adoption from a process, risk, and security perspective</li></ul>
 Implementation	<ul style="list-style-type: none"><li>• To assess the scale and scope of Smart RPA adoption along with the pace at which Smart RPA has been adopted – in terms of software robots deployed and time taken to scale up from pilots</li></ul>
 Organization & talent	<ul style="list-style-type: none"><li>• To assess the governance model for Smart RPA and the extent of collaboration among the implementing groups</li><li>• To analyze the talent management strategy for the organizational change caused by Smart RPA adoption</li></ul>
 Technology	<ul style="list-style-type: none"><li>• To assess the extent to which various components of Smart RPA technologies such as process mining, computer vision, and chatbots are being developed</li><li>• To assess the level of sophistication of various Smart RPA technologies deployed</li></ul>
 Resourcing	<ul style="list-style-type: none"><li>• To assess the sourcing strategy, training, and education programs for various Smart RPA skills</li></ul>

# Enterprise Smart RPA capability is assessed across four maturity levels

STEP 3

## The four capability maturity levels

Approximate share of enterprises at each maturity level **XX%**

Description	<ul style="list-style-type: none"><li>• Lagging behind peers in capability performance</li><li>• Poorly controlled and reactive</li><li>• Adopted in an ad hoc manner based on opportunities that emerge</li><li>• No major investment in terms of time and effort to improve the capability</li><li>• Primarily delivers some cost impact</li></ul>	<ul style="list-style-type: none"><li>• Capability performance at current peer/market levels</li><li>• Time and effort are put forth for some basic management and controls</li><li>• Some necessary disciplines are in place</li><li>• Delivers cost impact and some business outcomes</li></ul>	<ul style="list-style-type: none"><li>• Capabilities exceed typical performance levels</li><li>• Significant time and effort are put forth to develop advanced capabilities</li><li>• Delivers significant business outcomes</li></ul>	<ul style="list-style-type: none"><li>• Differentiated and best-in-class capabilities</li><li>• Exemplifies the way to success</li><li>• Well-planned and organized, thus setting the stage for innovation</li><li>• Delivers best-in-class outcomes and strategic advantage</li></ul>

# The automation journey itself will take different forms based on two sets of determinants – Smart RPA-related (science) and environmental (art)

STEP 4

# Given the same start and target states, enterprises' culture, structure, and other environmental determinants influence the routes they take

STEP 4

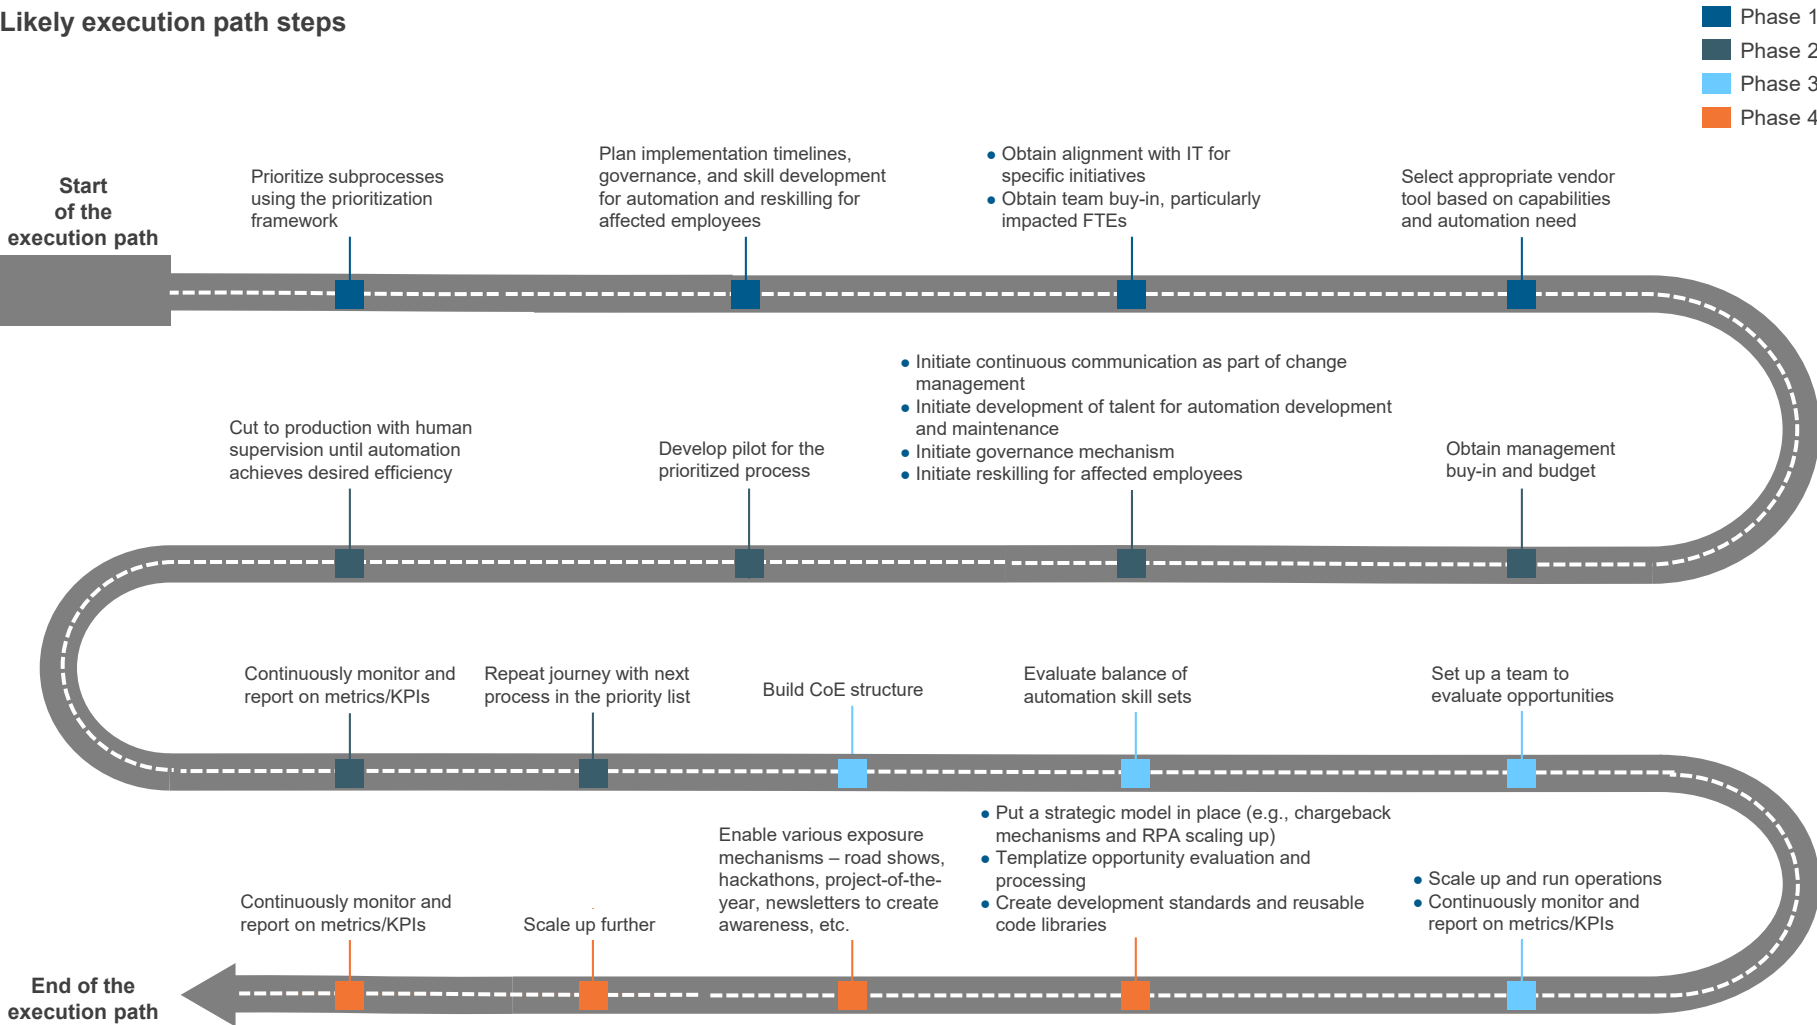

Two enterprises starting their journeys at the same low level of automation maturity and wishing to reach the same advanced target state may take significantly different execution paths; the path would largely depend on environmental determinants.

# While all enterprises will likely follow a set of steps in the execution path ...

## STEP 4

### Likely execution path steps

# ... the nature of those steps will vary based on environmental determinants<sup>1</sup>

## STEP 4

#	Steps	Determinants	Path options
1	Prioritize subprocesses using the prioritization framework	<ul style="list-style-type: none"> <li>• Sensitivity to change</li> <li>• Risk appetite</li> <li>• Current outcome &amp; capability</li> </ul>	<ul style="list-style-type: none"> <li>• Implement one process at a time</li> <li>• Implement logical groups of processes sequentially</li> <li>• Big bang implementation</li> </ul>
2	Plan implementation governance and skill automation and resk employees		
3a	Obtain alignment with initiative		
3b	Obtain team buy in, FTEs		
4	Select appropriate v capabilities and auto		

#	Steps	Determinants	Path options
5	Obtain management buy in and budget	<ul style="list-style-type: none"> <li>• Organization structure</li> <li>• Initiating stakeholder(s)</li> </ul>	<ul style="list-style-type: none"> <li>• Buy in and budget at team lead level</li> <li>• Buy in and budget at BU level</li> <li>• Buy in and budget centrally</li> </ul>
6a	Initiate continuous communication as part of change management	<ul style="list-style-type: none"> <li>• Sensitivity to change</li> <li>• People centrality</li> </ul>	<ul style="list-style-type: none"> <li>• Low to no communication</li> <li>• Medium frequency of communication</li> <li>• Frequent communication</li> </ul>
6b	Initiate development of talent for automation development and maintenance	<ul style="list-style-type: none"> <li>• Control over operations</li> <li>• Technology savviness</li> </ul>	<ul style="list-style-type: none"> <li>• Develop talent in-house</li> <li>• Use a combination of in-house and</li> </ul>
6c	Initiate governance		
6d	Initiate reskilling for		

#	Steps	Determinants	Path options
7	Develop pilot for the prioritized process	NA	NA
8	Cut to production with human supervision until automation achieves desired efficiency	<ul style="list-style-type: none"> <li>• Risk appetite</li> </ul>	<ul style="list-style-type: none"> <li>• Always employ a human in the loop</li> </ul>

#	Steps	Determinants	Path options
11	Build up scaling up structure	<ul style="list-style-type: none"> <li>• Organization structure</li> </ul>	<ul style="list-style-type: none"> <li>• Centralized operations</li> <li>• Hub and spoke model</li> <li>• Decentralized scaling up operations</li> </ul>
12	Evaluate balance of automation skill sets	<ul style="list-style-type: none"> <li>• Control over operations</li> </ul>	<ul style="list-style-type: none"> <li>• Develop talent in-house</li> </ul>

#	Steps	Determinants	Path options
15a	Put a strategic model in place (e.g., chargeback mechanisms and RPA scaling up)	NA	NA
15b	Templatize opportunity evaluation and processing	NA	NA
15c	Create development standards and reusable code libraries	NA	NA
16	Enable various exposure mechanisms – road shows, hackathons, project of the year, and newsletters to create awareness	NA	NA
17	Scale up further	NA	NA
18	Continuously monitor and report on metrics/KPIs	NA	NA

#	Steps	Determinants	Path options
9	Continuously monitor metrics/KPIs		
10	Repeat journey with priority list		

<sup>1</sup> Refer to pages 173-177 in the Appendix for a detailed list

# Use case: Consider P2P automation for two distinct organizations with different characteristics, both seeking to reach similar target states from similar current states

STEP 4

Consider two organizations with the same current state and achievable target state

- Current state: The organizations run a single ERP system with a workflow system for the P2P process. Neither have implemented any RPA or AI-based automation. Invoice and delivery notes are manually entered from scanned PDF or image-based documents. Each has five FTEs currently employed in each task
- Achievable target state: 60% automated entry for delivery notes and invoices

The ideal execution path for each organization would depend on environmental determinants such as those detailed below

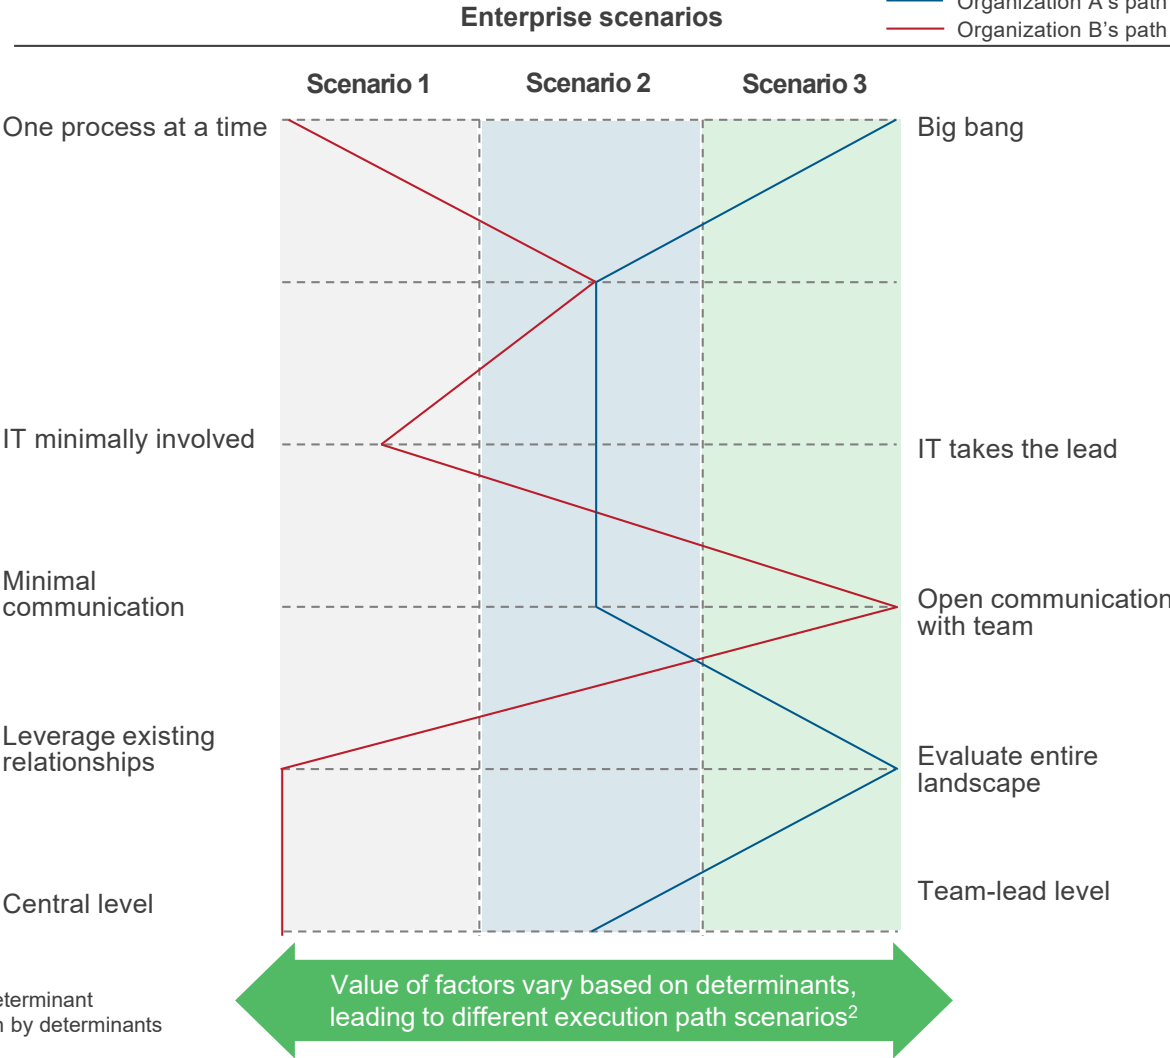

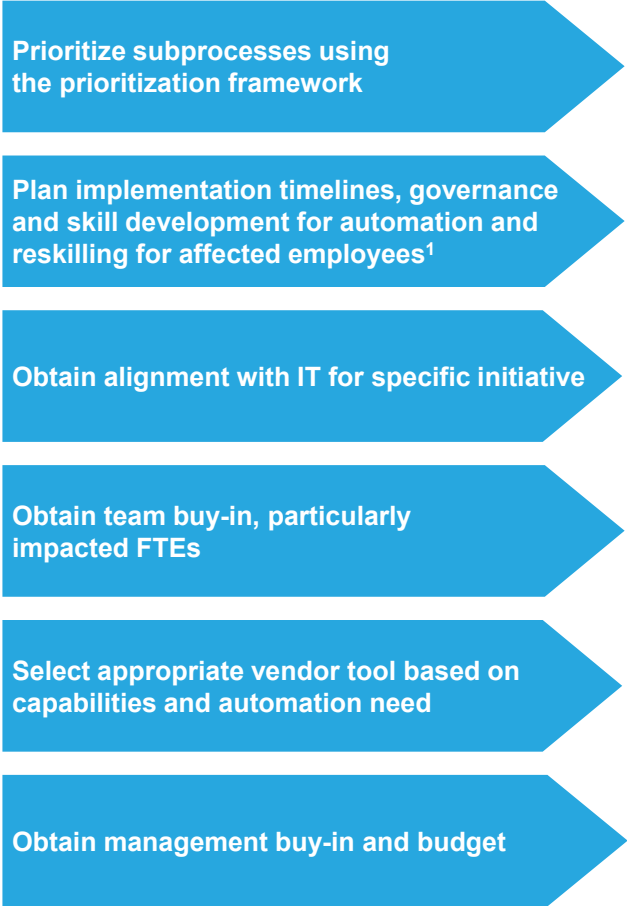

Organization A – digital-born e-commerce firm	Organization B – conservative regional bank
Decentralized	Centralized
Low people-centricity	High people-centricity – unionized
Fast changing organization/sector	High sensitivity to change
Technology-first	Slow adopters of technology
Operations analysts	Operations analysts
High risk appetite	Low risk appetite; heavy regulation
Low for non-core operations	High for all operations
None on the automation front	Existing relationship with automation vendor

# Execution paths differ based on environmental determinants

(page 1 of 2)

STEP 4

## Execution path factors

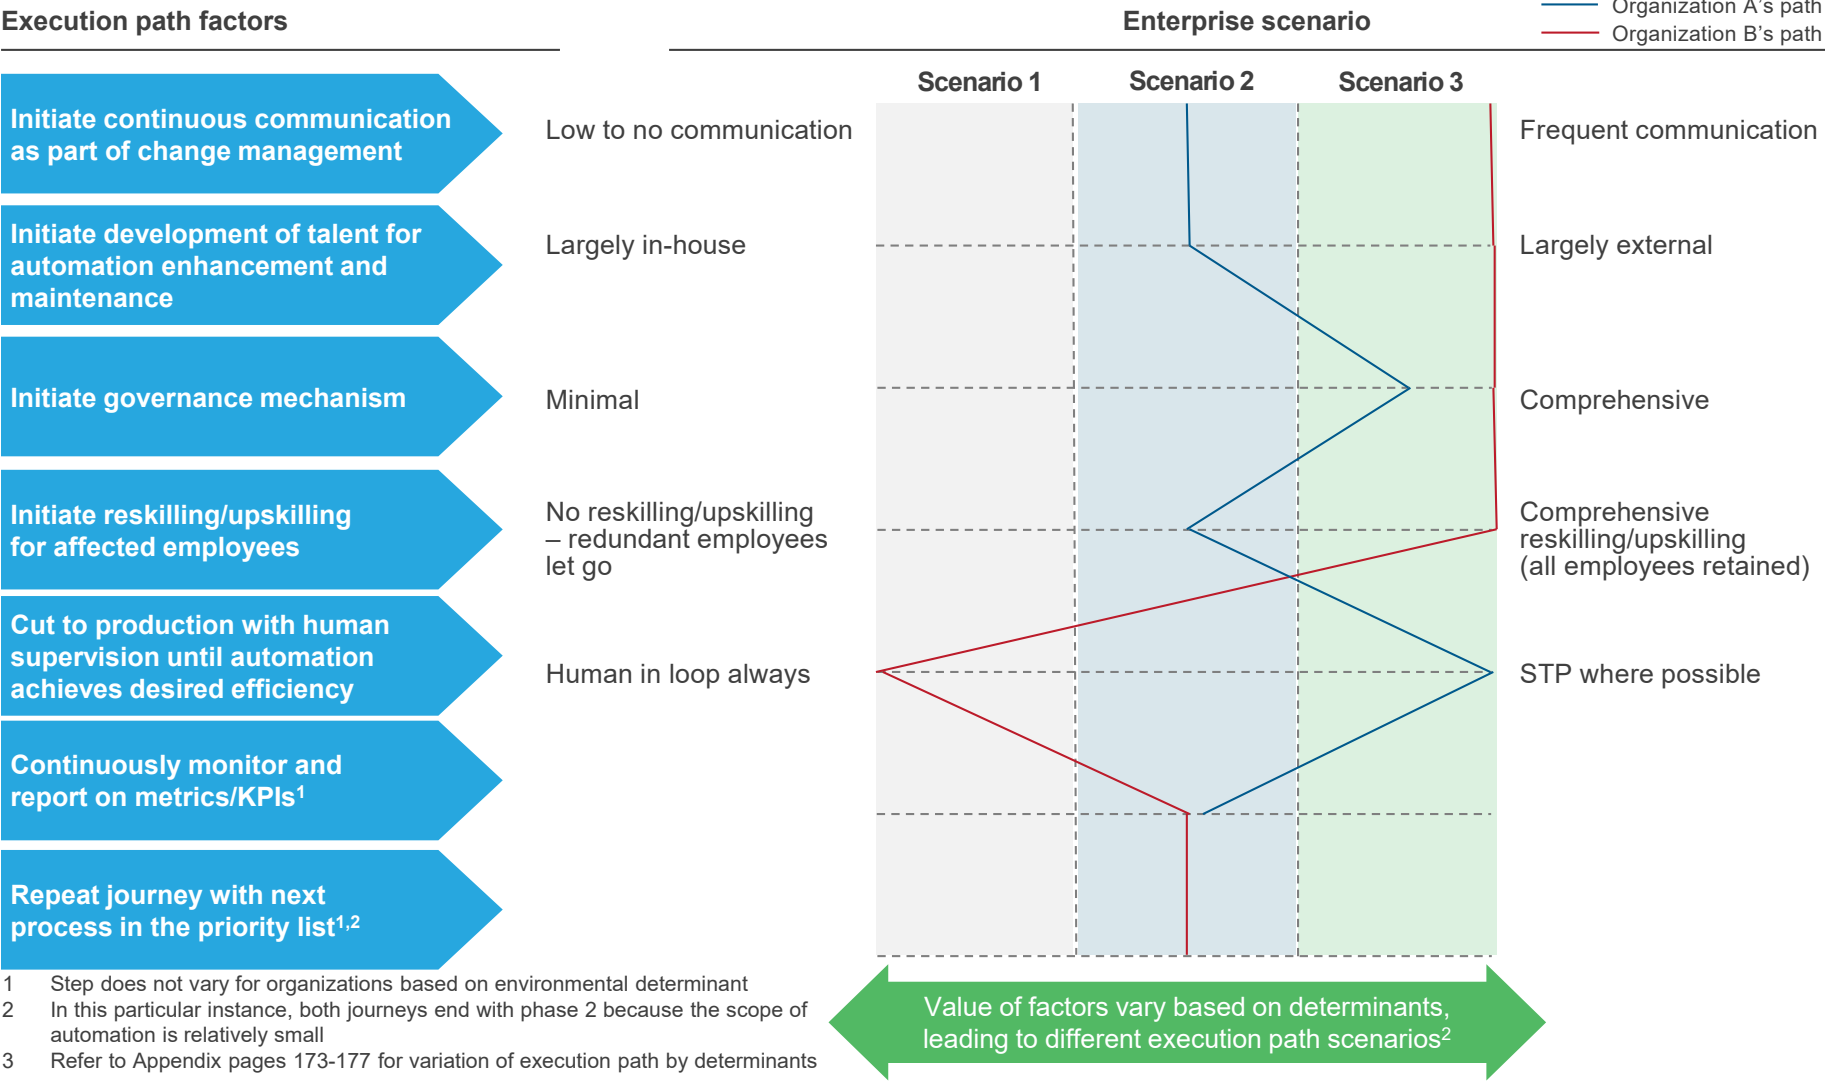

<sup>1</sup> Step does not vary for organizations based on environmental determinant  
<sup>2</sup> Refer to Appendix pages 173-177 for variation of execution path by determinants

# Execution paths differ based on environmental determinants

(page 2 of 2)

STEP 4

1 Step does not vary for organizations based on environmental determinant  
2 In this particular instance, both journeys end with phase 2 because the scope of automation is relatively small  
3 Refer to Appendix pages 173-177 for variation of execution path by determinants

# Having mapped the best-fit execution path, enterprises could leverage a variety of tools and best practices to develop an execution strategy and accelerate their Smart RPA journeys

STEP 5

Areas that are critical to successful execution of enterprises' Smart RPA journeys

1 Identifying and prioritizing processes for Smart RPA adoption

2 Optimizing processes before automating

3 Selecting enterprise-grade Smart RPA tools

4 Establishing and executing a Smart RPA CoE

5 Identifying and sourcing Smart RPA skills

6 Developing an effective change management program

# As an enterprise moves through each of the four phases of Smart RPA adoption, appropriate processes should be prioritized for implementation

Everest Group classifies enterprises' Smart RPA journey into four key phases

# Processes should be prioritized for automation using a structured, repeatable framework

The framework below helps identify high priority processes for Smart RPA based on overall automation potential and extant cost of operations. Additionally, the relative ease of implementation consideration helps prioritize within quadrants.

**For phase 1 and phase 2, easily implementable processes that deliver the maximum net benefit should be considered; for further scale, other processes can be considered as well**

#### Phases 3 and 4

- For phases 3 and 4, i.e., when scaling up beyond pilots, quadrant 1 continues to be the first priority, typically moving from easier- to harder-to-implement processes
- Upon exhaustion of processes in quadrant 1, processes in quadrants 2 and 3 can be selected (those processes for which the business case still makes sense)
- Typically, quadrant 4 processes are left as is, even in the high maturity phases, as there likely is not a strong business case for them. As technology matures, some of these processes may become attractive from a business case perspective, at which point they can be considered

# After identification of the appropriate use-case for automation, enterprises need to analyze the process to decide if it needs optimization/reengineering

Enterprises must not jump directly to the reengineering phase before automating; they should fully analyze process metrics before concurring on optimization

Key process metrics to consider	Minimum level for the metric to justify optimization	Final decision
Process variations	 Invariably, there will be process variations across business units or geographies; however, variations should not be to the level that they significantly hamper scalability	
Multiple stakeholders/departments involved	 There is a high likelihood that the process incorporates a lot of redundancies and is not lean if there are multiple hand-offs involved, which should justify optimization	Automate as-is without reengineering
Information travel between activities and security concerns	 Data travel and security concerns should be indispensably addressed, especially for sensitive customer-facing businesses such as insurance and banking	Partially reengineer the process before automating
Process sensitivity to any underlying systemic change	 If the process is even partially sensitive to any underlying infrastructure or configuration change, at least partial optimization should be considered to avoid setbacks during automation	Re-envision and reengineer the entire process
Regulatory non-intervention when modifying processes	 Regulatory restraints to optimization could be a big deterrent for enterprises to modify the as-is process state. These should be considered before deciding to reengineer	

# What does process reengineering entail for hassle-free Smart RPA deployments?

# In order to build the most efficient ecosystem of Smart RPA, enterprises need to consider the following five factors

## An integrated Smart RPA ecosystem

## Key factors to consider when selecting an enterprise-grade RPA platform capable of delivering an integrated Smart RPA ecosystem

1

### Technology capability

This capability will relate to the core technical functionalities of the RPA software employed

Access to an ecosystem of smart and collaborative technologies for seamless integration

2

### Ecosystem of partners for collaborative technologies

3

### Ecosystem of services partners

Access to service partners that can help enterprises in planning, implementing, and accelerating their Smart RPA journey

Access to robust and easily accessible product training to develop in-house skills/talent and for product support for smooth functioning

4

### Product training and support

5

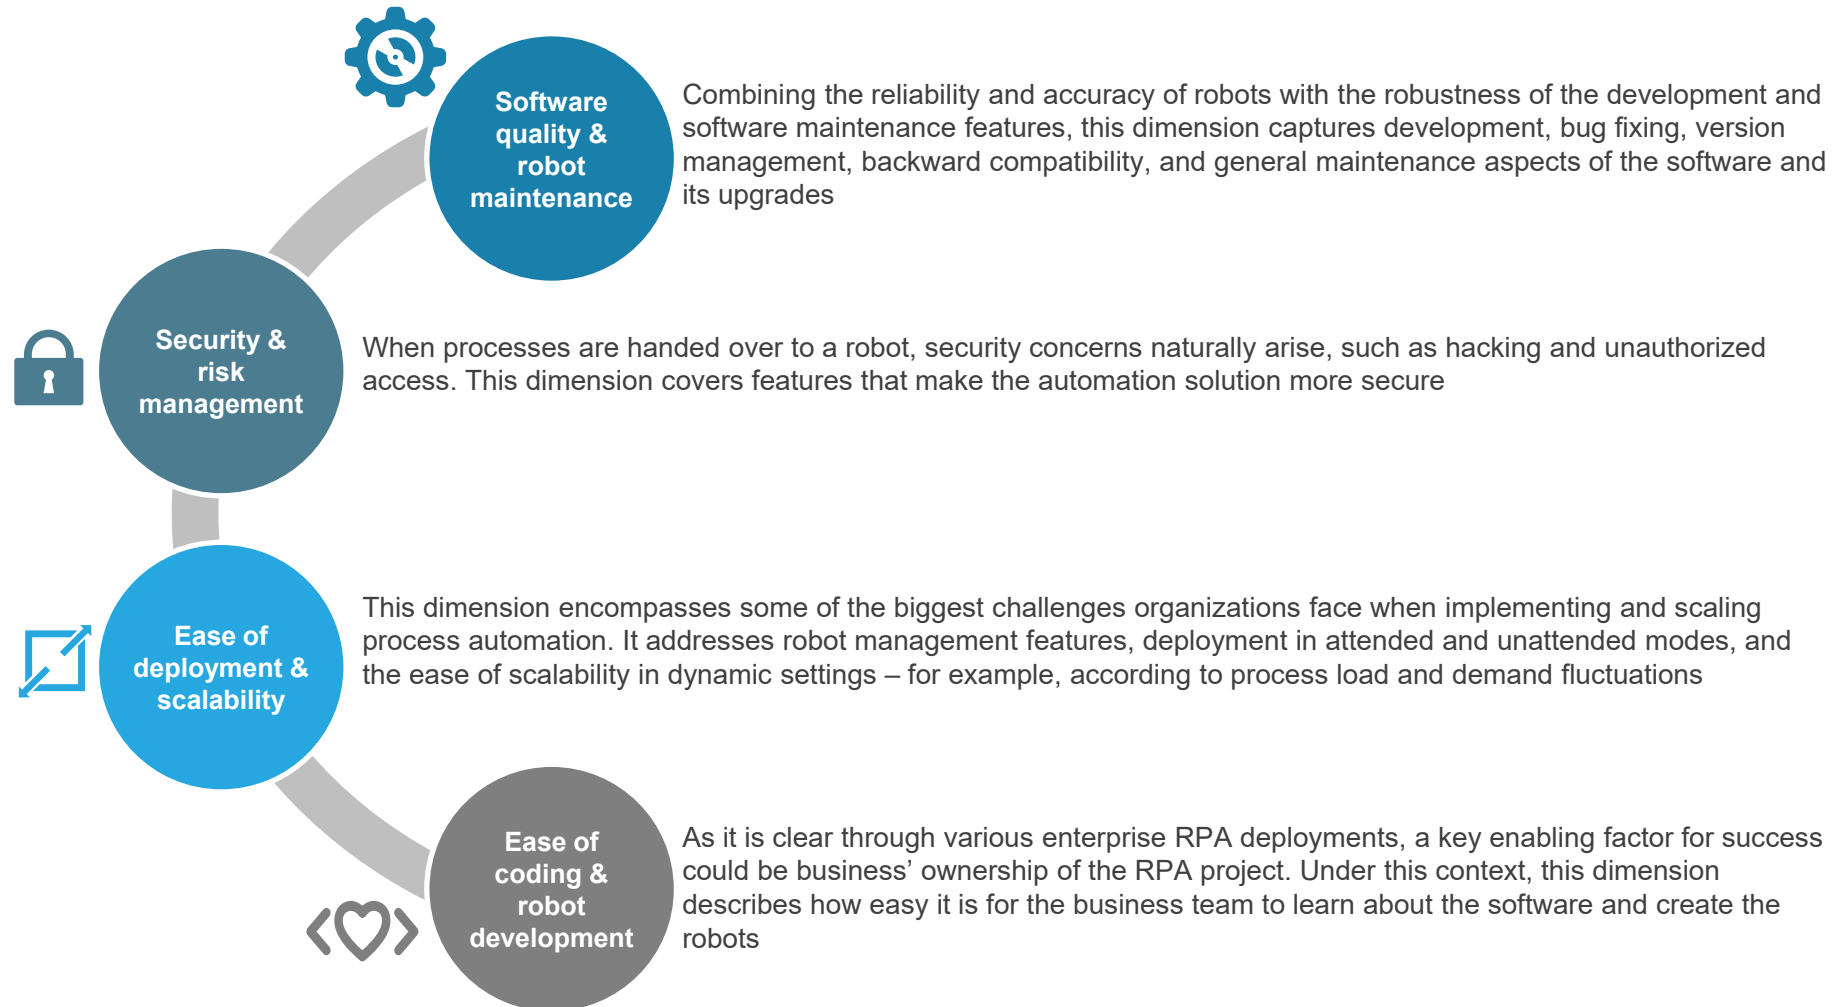

### Commercial models

Option to choose from a range of commercial models to suit enterprises' requirements

# While choosing among available RPA software options, enterprises need to consider four key dimensions related to the functionalities of these platforms

1

# Dimension 1: Software quality and robot maintenance

1

Technology capabilities			
Dimension	Sub capabilities	Brief on the sub capability	Important considerations
 Software quality & robot maintenance	 Bug-free with seamlessly integrated components	As the technology evolves, RPA tools often have functionalities/components that do not communicate each other, such as not being able to edit the decision logic for a robot created using a recording facility	<ul style="list-style-type: none"> <li>RPA technology is continually evolving; organizations should take a more forward-looking approach to tool selection</li> <li>RPA deployments will have unavoidable setbacks, and the tool should enable enterprises to continually evolve their deployments</li> <li>Monitoring, administering, and controlling the robots are crucial aspects, and the software should support these processes</li> <li>Robot maintenance should not cost enterprises more than the savings and efficiency improvements they actually generate</li> </ul>
	 Accurate identification of objects from the user interface	As RPA works on the user interface, this feature becomes a basic necessity and enterprises should not face problems when underlying screen resolution or related factors change	
	 Error log generation for debugging	In order to make it easier for the enterprise to determine related reasons for a transaction failure, it is imperative that error logs are generated by the platform	
	 Web-based interface to control and monitor robots	This feature enables enterprises to remotely monitor, manage, and control robots as and when required. This becomes even more important with large-scale robot deployments	
	 Software designed using object-oriented principles	As enterprises further re-envision and modify their underlying processes and workflows with automation leverage, object-oriented RPA software makes it easier to incorporate such modifications in the robot code	

## Dimension 2: Security and risk management

1

Technology capabilities			
Dimension	Sub capabilities	Brief on the sub capability	Important considerations
 Security and risk management	 Robust logging of robot activity or audit trails	For security and regulatory compliance, enterprises must maintain an audit trail of changes made to the robot and who made those changes; doing so will also help in subverting a fraud attempt	<ul style="list-style-type: none"> <li>How automation impacts or enhances enterprises' current security measures is an often overlooked, yet crucial, aspect</li> <li>This issue is even more important for industries such as BFSI that deal with sensitive customer information; incidentally, this is the industry in which the potential of Smart RPA is quite significant</li> <li>Given the intense regulatory activity around establishing a robust security infrastructure, this dimension should not be missed when considering automation deployments</li> </ul>
	 Adherence to security standards	Due to cybersecurity threats, a robust cybersecurity infrastructure is a necessity for both enterprises and regulators. The RPA tool should supplement these necessities by adherence to security standards	
	 Credentials vault	In enterprises, access to passwords is usually restricted, creating a compliance issue with RPA. A robust credentials vault helps in convincing security teams to share access with robots	
	 Role-based access controls supporting multiple roles	Role-based controls allow clear demarcation of the type of access to robots' administrators/users/designers. For example, who is allowed to configure/reconfigure the robots should be clearly defined	
	 Capability to run robots behind locked screens	For compliance with enterprises' security policies, robots should be capable of ensuring data privacy and running automated processes behind locked screens so that the user does not get access to more information than is intended	

## Dimension 3: Ease of deployment and scalability (page 1 of 2)

1

Technology capabilities			
Dimension	Sub capabilities	Brief on the sub capability	Important considerations
 Ease of deployment and scalability	 Scheduling, queuing, and other robot management features	The software should allow straightforward scheduling, queuing, and conditional execution of robots based on some pre-defined trigger events	<ul style="list-style-type: none"> <li>The ROI that an enterprise can achieve from its automation initiatives, depends to a large extent on the scale achieved. Spread-out pockets of small-scale automation would yield minimal benefits at best</li> <li>Many enterprises have found themselves going back to the drawing board when the deployments are scaled up, as many new exceptions and administrative hassles crop up</li> <li>In order to avoid such issues and ensure scalability with minimal additional cost, the RPA tool selected should provide the necessary scalability functionalities</li> </ul>
	 Caching of operational information for recovery	Ease of recovery is important for enterprises that are scaling up their deployments; its significance is evident from the multiplication of exceptions occurrence once the robots are scaled up	
	 A central application server that can run unattended	Achieving scalability is less challenging with the provision of a central server that can handle robot execution and recovery; if it is unattended, no additional people costs will have to be borne	
	 Role-based access controls supporting multiple roles	Many functionalities could be considered such as a duplicable centralized server, reusability of robot parts, autonomous execution, and process orchestration	
	 Option to run on a virtual machine or cloud	This option would allow enterprises to make the most of their infrastructure while also optimizing speed of automation and robot performance	

## Dimension 3: Ease of deployment and scalability (page 2 of 2)

1

Technology capabilities			
Dimension	Sub capabilities	Brief on the sub capability	Important considerations
 Ease of deployment and scalability	 <p>Ability to be deployed in both attended and unattended modes</p>	Automating certain processes might require the user's input before the robot is invoked for the automated action, while others might run on a virtualized desktop without any user interaction	<ul style="list-style-type: none"> <li>Ease of deployment depends on the variety of functionalities available with the RPA platform that allows enterprises to customize the deployment to their operational requirements</li> <li>These functionalities could translate into options to run attended/unattended robots or to deploy on virtual machines / centralized servers / desktops</li> <li>Scaling up the deployments should not proportionately increase resource requirements or the realizable ROI would be negatively impacted. RPA software that allows for the most efficient resource usage should be considered</li> </ul>
	 <p>Ability to auto-scale depending on process load</p>	How fluctuations in transactions volume for an enterprise affect robot activity depends on the robotic platform's capability to dynamically adjust robotic resource usage	
	 <p>Ability to execute multiple operations in parallel</p>	A parallel execution of automated process' multiple instances or multiple robot runtimes will increase processing speeds and also optimize resource leverage	
	 <p>Support for REST or SOAP web services and support for integration</p>	In addition to support for REST or SOAP web services, the RPA solution should be capable of both inbound and outbound integration with these web services	
	 <p>Open architecture of the platform</p>	Open architecture allows easy customizations for communication among robots and legacy systems and integrations such as with AI technologies for a more holistic end-to-end coverage of processes for automation	

# Dimension 4: Ease of coding and robot development

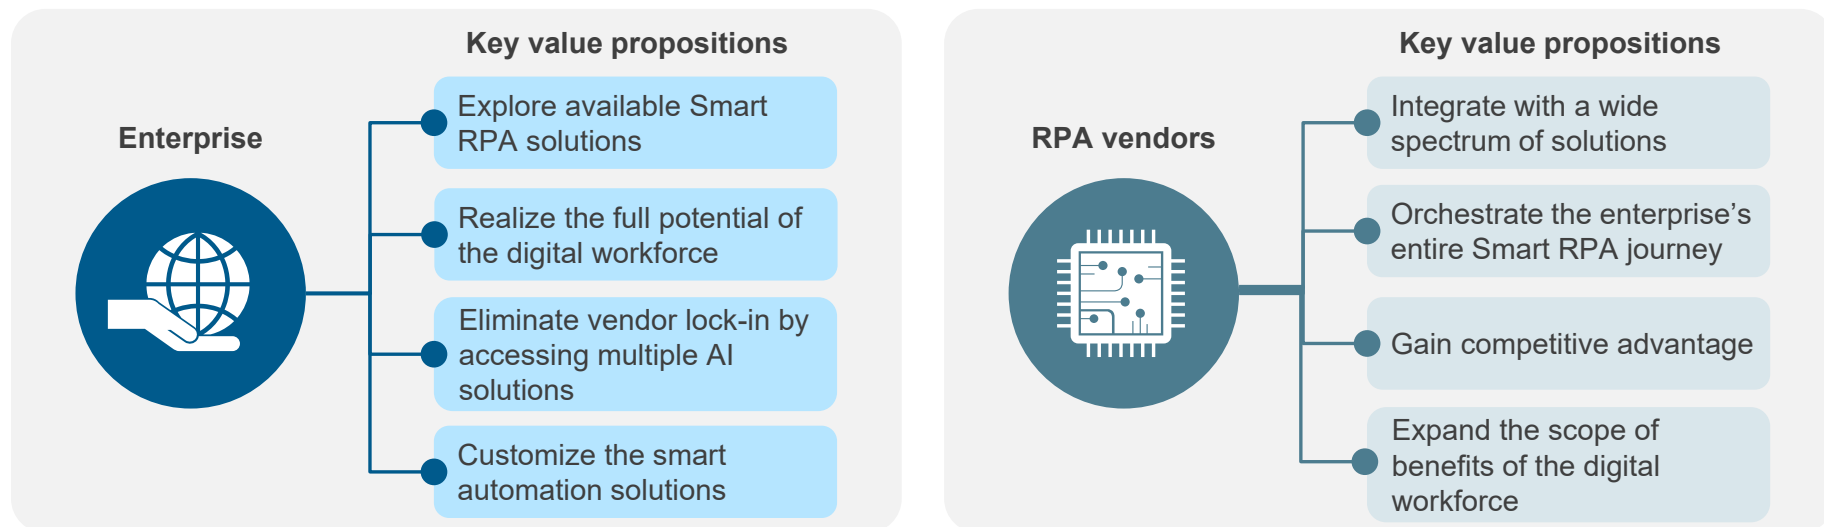

1

Technology capabilities			
Dimension	Sub capabilities	Brief on the sub capability	Important considerations
 Ease of coding and robot development	 Non-invasiveness	The RPA solution should be able to seamlessly integrate with the UI layer of the computer-centric business process; this is more important for enterprises with system integration problems	<ul style="list-style-type: none"> <li>A large part of the value of an RPA software lies in the ease with which the robots could be coded and modified by not only technical manpower but business users as well</li> <li>While Smart RPA increases the potential for automating more complex and judgment-intensive business processes, this all could render futile if the code creation is itself complicated</li> <li>Not all the features under this dimension would demand exclusive attention of enterprises as some of these have started to find their way in almost all the major RPA vendors' offerings. Enterprises should rather look at the differentiating aspects and justify usability in their businesses</li> </ul>
	 Availability of pre-built integrations with leading software applications	Automating most of the front and back-office business processes would require the RPA layer to push and pull data to and from the various enterprise applications where pre-built integrations could come in handy	
	 Ability to create manual steps with robot tasks	Almost all processes require robots to work with human touchpoints in the workflow. A robotic platform that enables developers to chart out human and robot workflow is crucial	
	 Extensive libraries of reusable automation components	Access to or the ability to create libraries of reusable workflows, methods, or components would help speed automation across different processes	
	 Version control and management	By making it easy for users and developers to update and manage versions of robot code and track what changes have been made, unnecessary impediments to robot development and maintenance could be avoided	

## Why access to customizable RPA solutions is crucial for enterprises

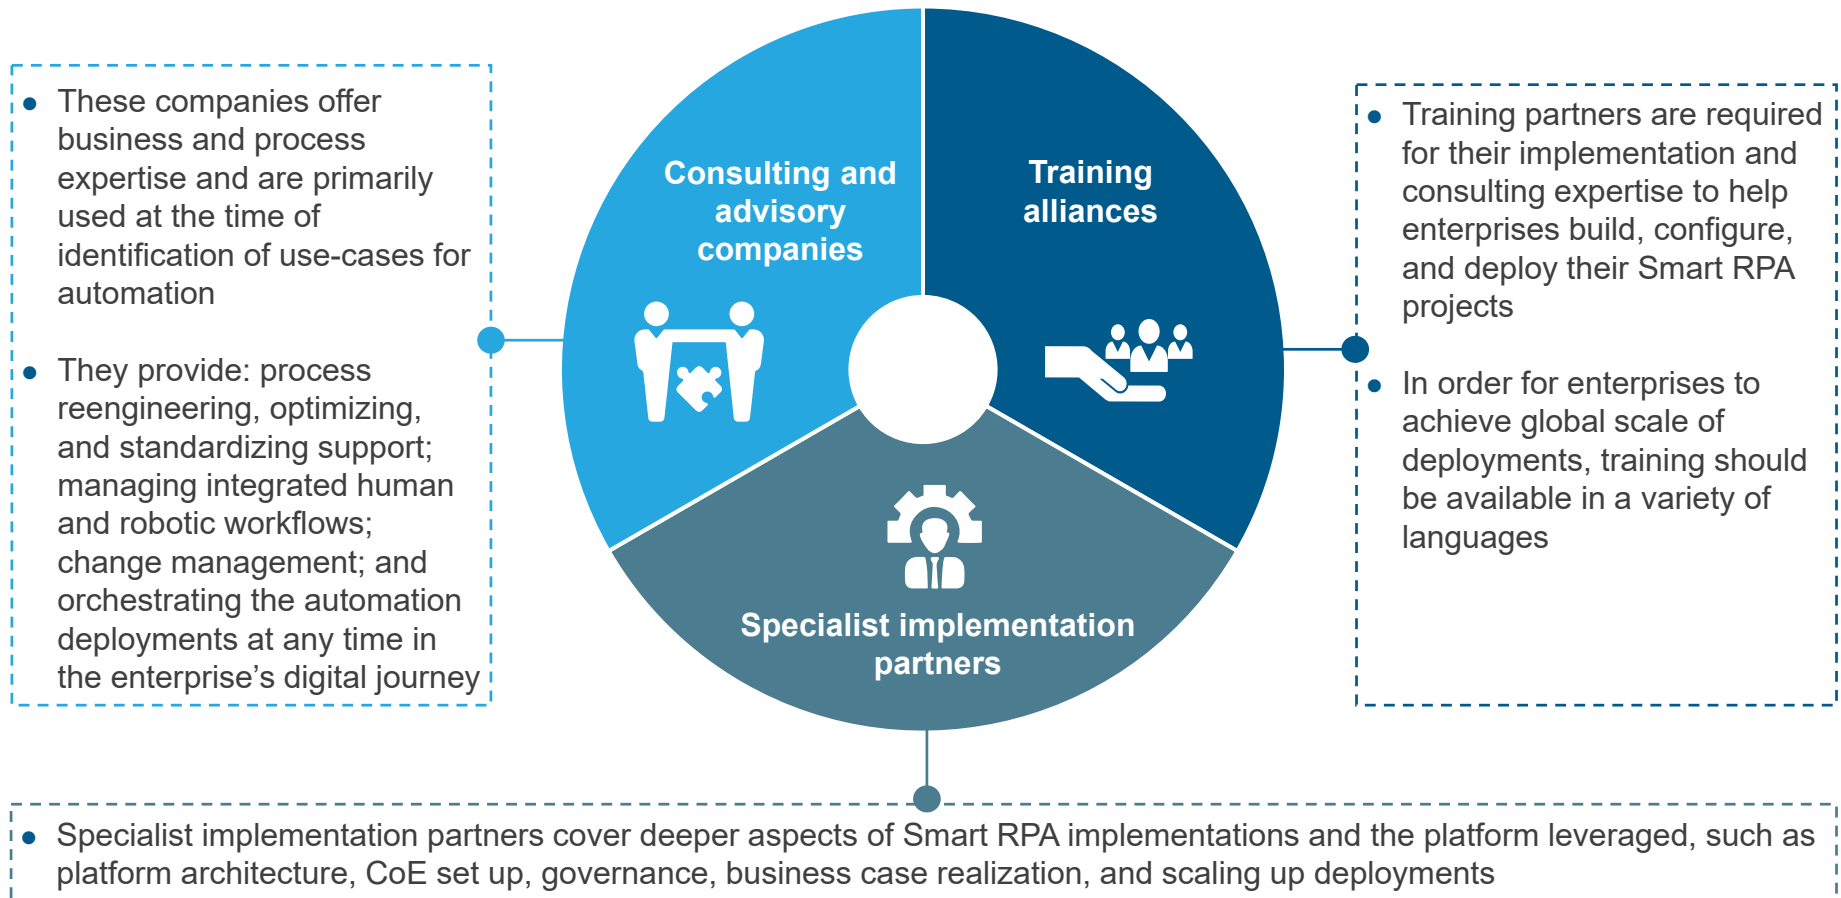

- RPA by itself does not impart the full benefits of automation and can only handle mostly transactional activities. In order to realize the maximum potential from automation, integrating the RPA platform with AI and other collaborative solutions is imperative
- Integration with AI also increases the STP rates that the enterprises can achieve in their automated processes. This integration not only generates operational efficiencies but could also be a vital source of competitive advantage and attracting new customers
- If an enterprise's chosen RPA vendor is able to provide access to a broad partner ecosystem for collaborative technologies, in the future the enterprise would not have to reconfigure its RPA deployments or face hassles in integrating collaborative technologies with its current RPA platform

## What a robust partner ecosystem of collaborative technologies means for enterprises and RPA vendors

# Ecosystem of implementation partners

3

## Three main tenets of product training and support

### Good product support and maintenance services

- Product support and maintenance are very important for a smooth journey experience and hence, enterprises should look for Smart RPA vendor(s) that offer proper and continuous product and maintenance support
- Enterprises should be able to meet their required service levels with Smart RPA, and the vendor should be capable of providing support to do so
- Uniform product update/release cycle and maintenance services helps enterprises avoid/minimize challenges with their deployments, especially when they have scaled up their deployments. An enterprise's IT and operations department should not be burdened with issues resulting from inadequate product support, but rather be assisted to ensure the most efficient use of limited resources

### Easy access to robust product training

- Provision of a training platform with robust training documentation that can be downloaded and viewed offline, and self-paced online training courses and certifications should be an important consideration in Smart RPA vendor selection
- Structured training material enables an enterprise's developers and users of automation solutions to accelerate their learning curve, deployment, and usage

### Open source product training courses and materials

- Open source product training materials ensure continuous updating of information as developments occur
- An online community platform where users/contributors can answer a query or disseminate information is often very helpful to enterprises in their automation journey. These platforms enable them to learn best practices from relatable initiatives, while keeping them abreast of recent developments and technology upgrades

# Commercial models

Enterprises should evaluate available pricing options to select a model that best aligns with their requirements and planned roadmap

Commercial models available in the market and the definitions entailed vary widely from vendor to vendor. Enterprises should be thoroughly conversant with the available options and evaluate them according to their requirements and roadmap for automation

Perpetual licensing

The enterprise pays an upfront fee for technology and software licenses for a long term plus an Annual Maintenance Charge (AMC); low recurring costs

Subscription-based

Fixed capacity

The enterprise pays a fixed fee for the term (generally annually) for each robot, inclusive of maintenance costs

Transactional- / per process-based

Pricing is directly and linearly linked to discrete units of outputs delivered by the Smart RPA technology to the enterprise; the price is based on discrete unit of output

Usage-based

The enterprise pays for robot usage; best for buyers whose requirement and workload volumes vary significantly

Outcome-based

Pricing linked to outcomes; i.e., measurable cost or revenue impact delivered to the buyer; price based on gainsharing model

## Key factors affecting the suitability of commercial models

- Scale of deployments planned
- Frequency of processes to be automated
- Predictability of transactional volumes
- Scope of engagement with the vendor
- Roadmap and timelines to scale up deployments

# The why and wherefore of setting up a CoE (page 1 of 2)

## Why is it needed?

- A CoE provides a strong centralized structure and governance for a variety of aspects of automation including sharing skills, resources, assets, coding and security standards, and best practices
- It encourages reuse of robot assets and code
- It enables consolidation and optimization of automation solutions, vendors, and licenses
- It can ensure full utilization of robot assets and licenses across the enterprise
- These factors, which help to address specific business or operational needs, all contribute to the business case for the scaling up as well as other drivers

## How does a CoE operate?

- A CoE can operate in different ways; operations may vary according to the enterprise's culture and business requirements
- It is a central shared service that helps multiple parts of the organization automate their processes
- It can be funded and governed either at the corporate level or by business units and their representatives

## What services does a CoE offer?

- A CoE typically offers automation expertise combined with a good level of knowledge about the organization's business processes
- It is common for a CoE to work with business units to design and develop their robots and test and maintain them
- It can also offer deployment, application management, and a control tower. However, a balance is needed; too many responsibilities too soon could break the CoE initiative or turn it into a bottleneck

# The why and wherefore of setting up a CoE (page 2 of 2)

## When is a CoE set up?

- The best time to start setting up a CoE is at the start of the organization's automation journey. This timing will ensure that the organization learns once and shares its knowledge and skills many times
- The CoE can start as simply as capturing automation project documents and best practices and grow its skills, scope, and responsibilities over time
- Another approach is to set up a CoE once the initial proofs of concept have been completed, and the project files, skills, assets, and lessons learned can be transferred to it for reuse and sharing
- The business case can influence when a CoE is started. The drivers determine when the CoE starts and if a particular requirement should be dealt with before others. A fast set up for a specific requirement can run parallel with other scaling up deployment activities, such as cataloging existing automation software

## Where should a CoE be located?

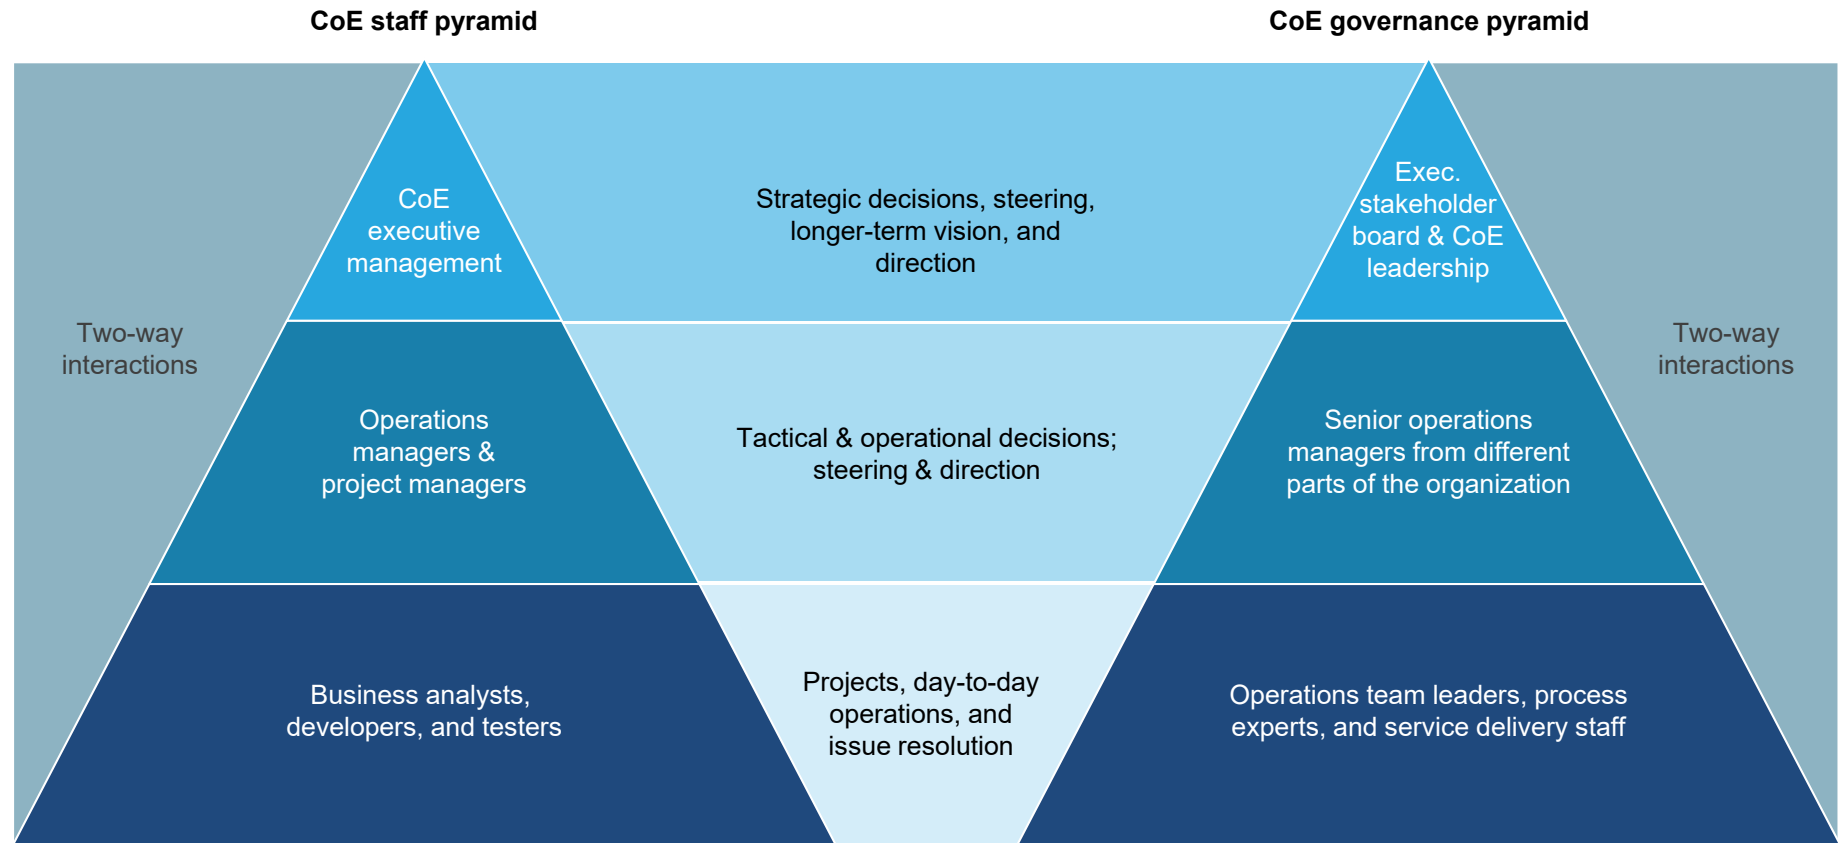

- There are various models for CoEs including a centralized delivery location, much like a shared services center enabled by virtual and multiple customer interaction channels. This is the best suited to Smart RPA because of the need for deep collaboration with IT and other supporting functions to build capabilities for AI
- There is also the distributed hub and spoke mode, which gives the CoE a physical presence to serve customers in different geographies

## Who owns the CoE?

- CoEs are typically owned and managed by the corporate operations optimization function
- Organizations will also have to decide who owns and is responsible for software licenses, automation source codes, methodologies, and other IP – the CoE, the corporation, or the business units

# The CoE pyramid has three distinct layers that define its governance structure

## CoE governance model

# Each layer within the CoE pyramid has a unique set of responsibilities

## Strategic decisions, steering, and direction

**The CoE and the executive stakeholder board decide the long-term strategy for the CoE, including decisions such as:**

- Funding and governance models including criteria for prioritizing automation requirements
- Performance reviews
- Expansion
- If the CoE needs to expand in size for current operations
- If the CoE needs to expand to offer more services or to offer services to new groups and in new geographies
- Supplier or service provider executive relationships, partnership, or procurement strategies

## Tactical & operational decisions; steering and direction

**Senior operations managers, line of operations managers, and program/project managers are responsible for mid-term planning:**

- They address requirements such as infrastructure and capacity planning, risk and compliance policies, resourcing, and aligning of CoE work with operational priorities
- The steering group tracks CoE performance at a detailed operational level. It collects information from operational teams, addresses issues, and reports to the executive stakeholder board
- Within the CoE, mid-level managers are responsible for technical skills development. They arrange trials of new technologies and manage the relationship with suppliers and service providers' mid-level managers

## Projects, day-to-day operations, and issue resolution

**This is the group that uses the automation software and robots and ensures smooth daily operations:**

- Within the CoE, business analysts, developers, and testers are engaged in the design, development, and day-to-day running of automation efforts, typically supported by the central IT group (for infrastructure support)
- They work closely with their operations clients and process experts to ensure consistency in design; they also test for accuracy and adherence to client specifications
- They collect daily operations information and report internally and to senior management
- Process experts and operational staff have to make sure that processes are run according to schedules and priorities. They check the outputs of the automated processes and report quality issues to the CoE staff
- They ensure that CoE personnel are made aware of changes to process requirements

# There are different CoE models, the most common of which are centralized and hub & spoke

The centralized CoE model

The hub & spoke CoE model

# The centralized CoE offers the strongest structure for Smart RPA and maximizes standardization, but limits geographic presence and local knowledge

## Advantages of a centralized CoE include

- A centralized CoE is the most suitable for Smart RPA because it can liaise with corporate functions such as IT and data management to create the organization's AI capabilities
- A centralized CoE can maximize adherence to corporate automation policies, governance, and management reporting by having all staff under one roof and following the required procedures
- It can also maximize standardization of software tools and, with that, increase the depth of expertise in the tools
- It can make the most of existing automation assets through re-use and re-deployment to other business functions
- The centralized CoE can offer a physical presence to local business units and interact with others remotely and virtually
- A centralized CoE results in cost efficiency with only one center to run and manage

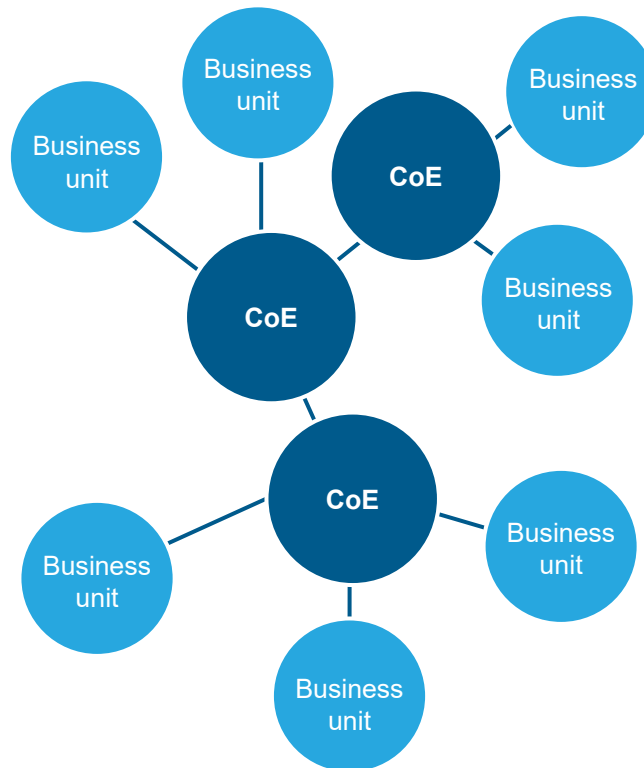

- A centralized CoE can become too rigid in its pursuit of adherence to policies and procedures
- It can be too remote from BUs in different geographies to fully understand their needs and cultural differences
- It can become too inward-looking and miss out on new automation opportunities or business innovation

## Disadvantages of a centralized CoE include

# While a centralized CoE offers the strongest structure for Smart RPA and maximizes standardization, it limits geographic presence and local knowledge

## Advantages of a hub and spoke CoE include

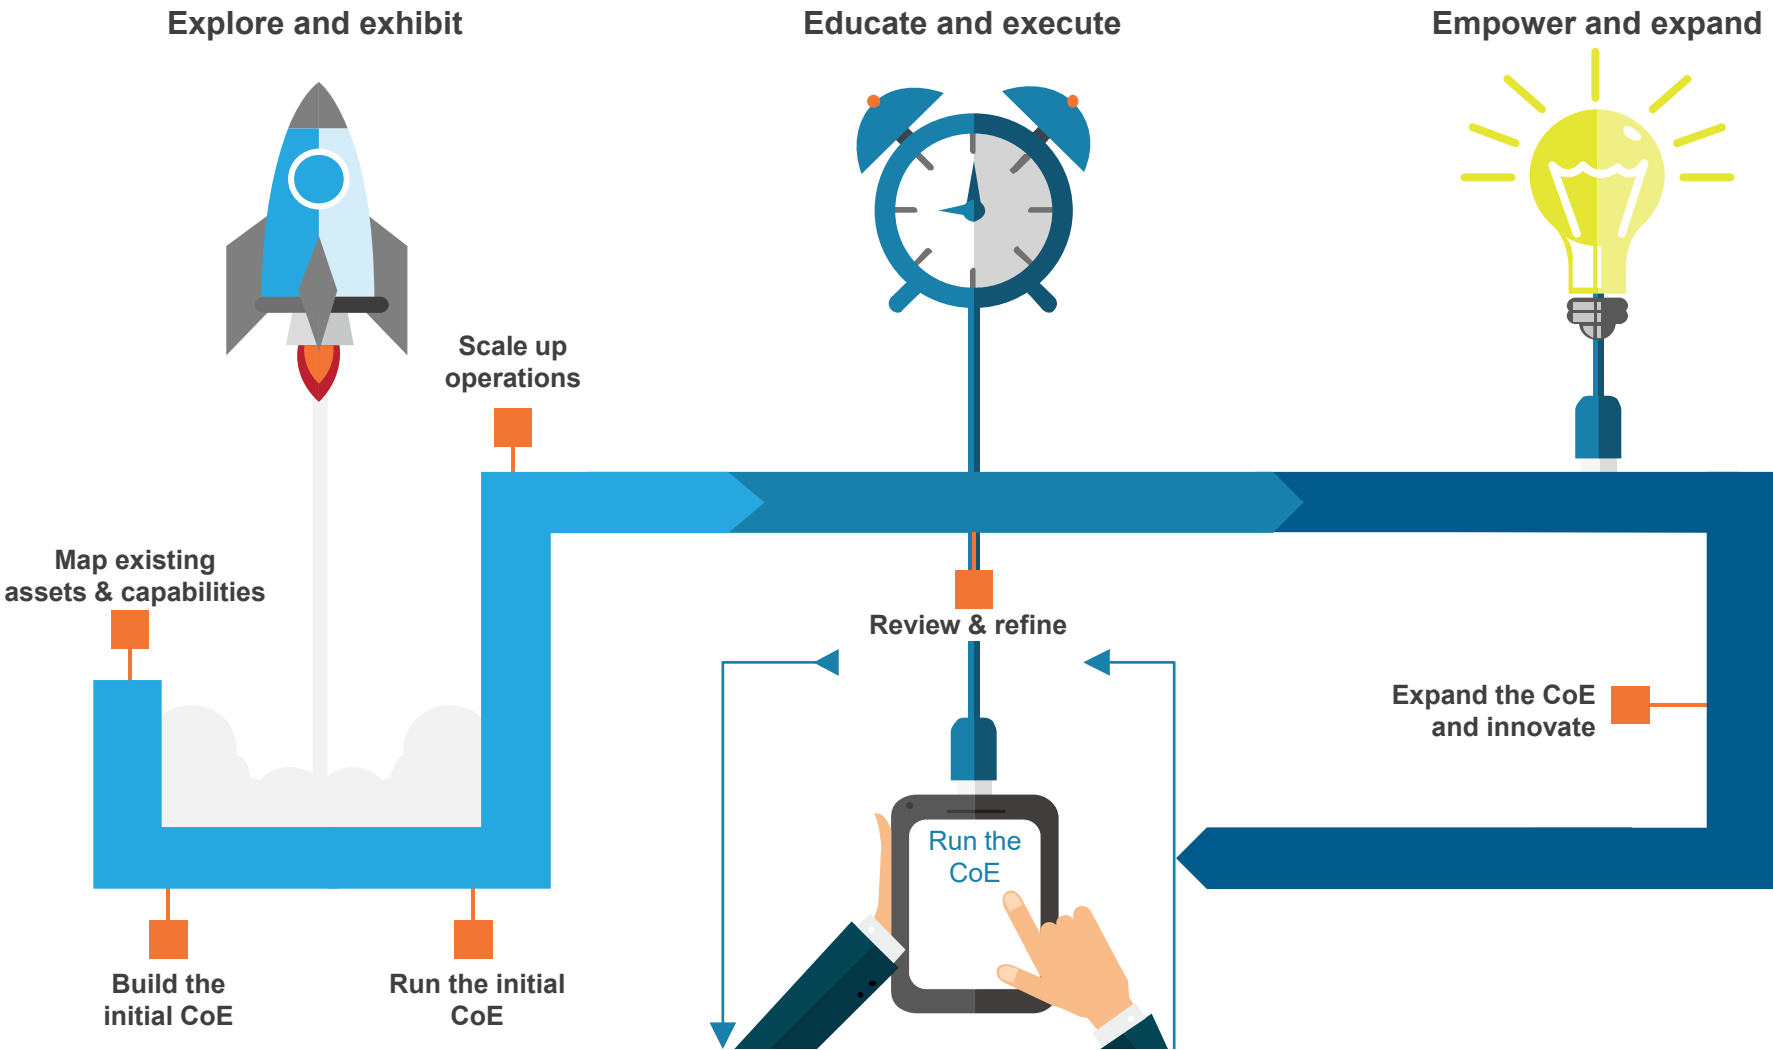

- In terms of Smart RPA, the central hub of this model plays a vital role in coordinating IT, risk, and data management requirements at a corporate level, thus creating the core capabilities that the spokes need to automate processes in a distributed competency model
- The spokes can develop Smart RPA, complemented with local or functional knowledge
- The spokes can develop automations based on expertise in local policies and procedures
- The spokes can specialize in processes that are run in one location and not in others
- Non-specialized process automation services can be pooled and run from the central hub

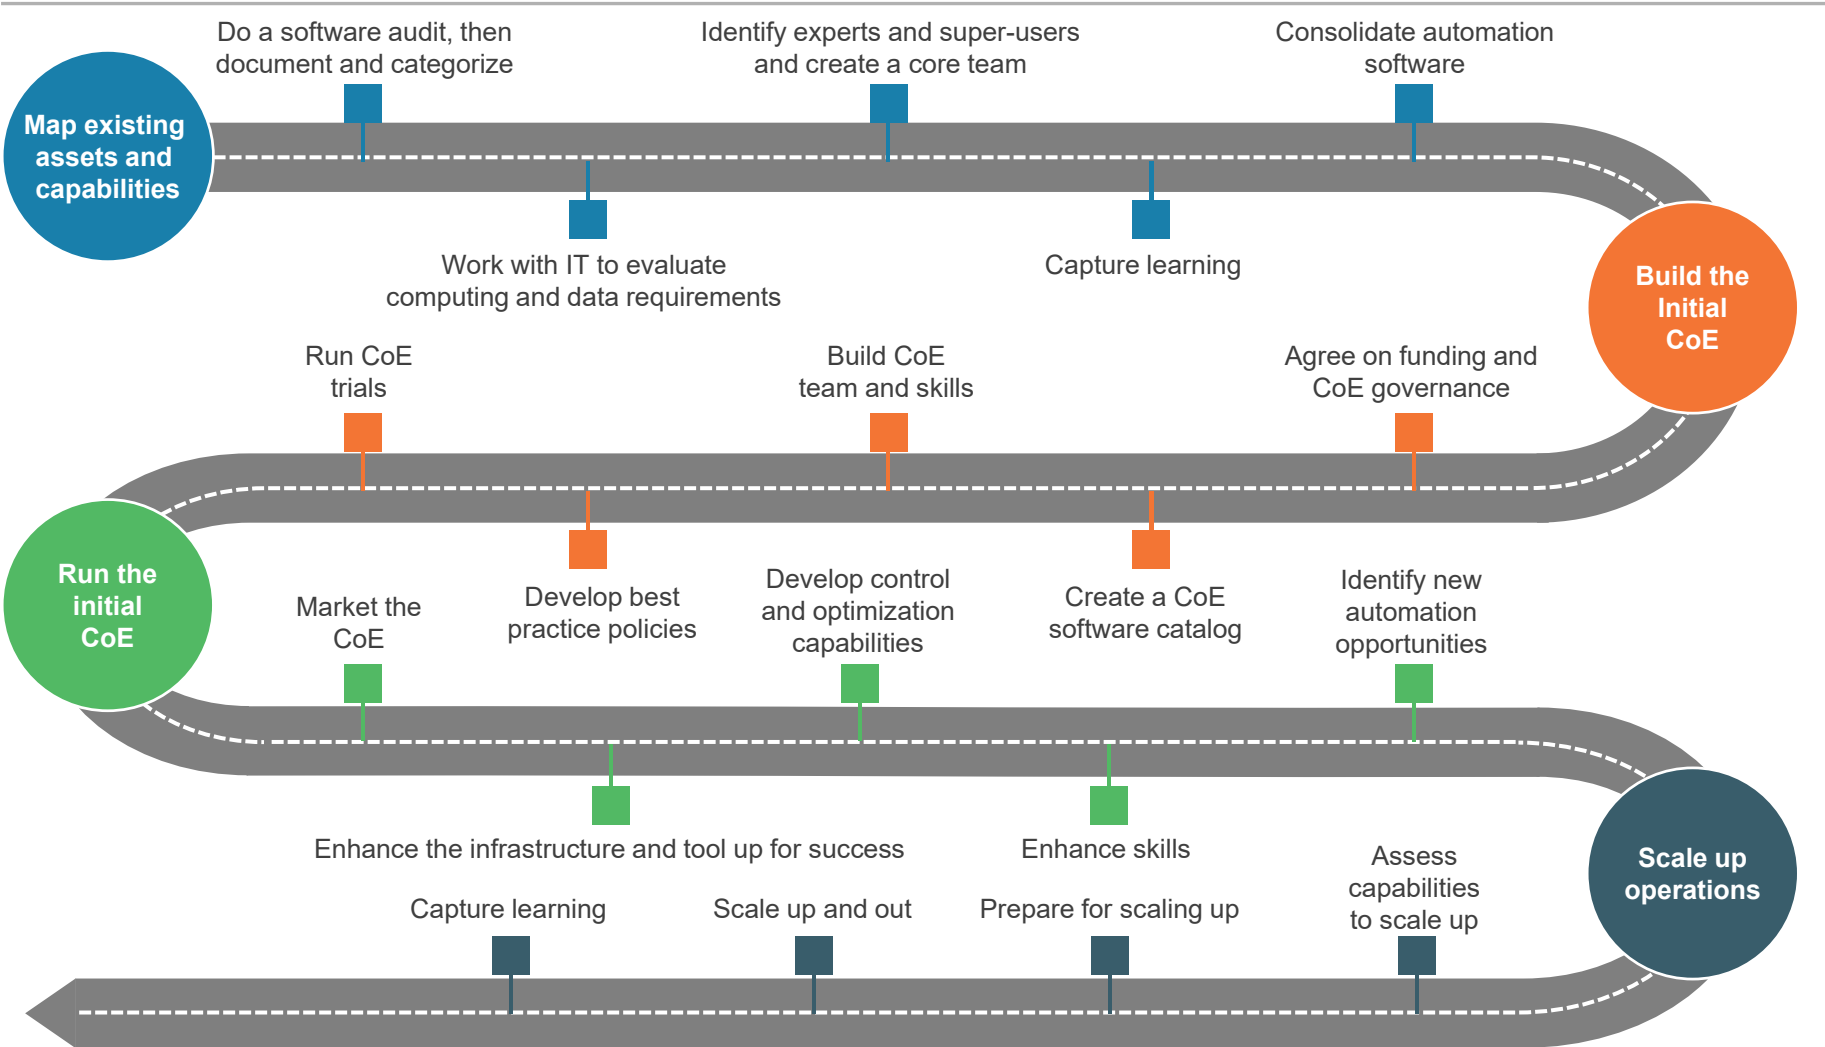

- The spokes can implement Smart RPA only if the central hub has created capabilities for AI in collaboration with IT and other supporting functions
- Availability of Smart RPA skills can be limited in some geographies
- It may be more challenging to standardize tools and procedures
- Duplication of knowledge and skills in hub and spokes can minimize benefits of the shared model
- More effort is required to manage ongoing communications, training, and policy updates

## Disadvantages of a hub and spoke CoE include

# Enterprise journey 1 (page 1 of 2)

While the start of the RPA journey was laden with setbacks, learning and adapting quickly helped this enterprise to achieve stable and scalable RPA implementations

## The initiation of the enterprise’s RPA journey

The enterprise began its RPA journey in the finance function of a shared services center almost 18 months ago, with a directive from the CFO. Even then, buy-in from the entire senior management proved difficult due to skepticism among stakeholders around risk, data security, and governance concerns with a third-party provider that had earlier proposed process automation. These dynamics changed when a new Vice President, brought in to head the shared services, was fairly optimistic about the potential of automation. The enterprise engaged a consulting partner in the initial phases of business case development, after which there was a gradual process of internal transition and capability development.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>• Cost savings was the primary driver for senior management</li><li>• Further into the implementation, the benefit metrics also included operational and business impact</li><li>• Ease of regulatory compliance is another added objective, as the enterprise is in a heavily regulated industry</li><li>• Headcount reduction or avoidance were never objectives, as the organization believes that organizational productivity is further improved when FTEs are deployed on more business value-additive tasks</li></ul>	<ul style="list-style-type: none"><li>• Initial buy-in from senior management, who were sceptical about RPA adoption being more disruptive than productive</li><li>• Significantly non-standardized processes across regional markets. Standardization across the globe became a huge challenge. An initial lack of knowledge about process’ fragmentations could exacerbate deployment later</li><li>• Finding experts / human resources competent and experienced in automation, particularly as the third-party consulting partner’s RPA and business process expertise proved insufficient</li></ul>

### Current status of the RPA program

About 18 months since the automation journey started

Started with six pilot processes

Currently 20 processes involving 12 robots in production each day

Machine learning leverage in future roadmap

Everest Group®  
RESEARCH

EGR-2018-38-R-2824

92

# Enterprise journey 1 (page 2 of 2)

There were notable implementation approaches employed, such as considerable focus on buy-in from multiple stakeholders, that led to the achievement of desired business objectives

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>• While the project initially was started as a small RPA initiative, the enterprise has built adequate understanding of and capabilities for automation implementation and expected setbacks</li><li>• In the initial six months, the organization undertook proper process documentation to identify robot control points and human and bot interactive workflow in the automated processes</li><li>• Multiple stakeholders came together to contribute to governance establishment. Financial control, external audits, information control, internal IT, and the RPA team collaborated to decide how to manage robot user IDs, control access, and deal with security breaches and credential information leakage</li></ul>	<ul style="list-style-type: none"><li>• Reduction in direct external spend on outsourcing by bringing processes back in-house and automating them</li><li>• Reduced cost of new hires</li><li>• Between those two outcomes, the organization anticipates a potential savings of US\$6 million in the future, depending on the extent of achievement of automation objectives</li><li>• The enterprise has already recovered its investments in RPA</li></ul>

## Winning insights

- At the initial stages, project leads ensured buy-in from senior management, which could prove to be significantly enabling for RPA adoption in the later stages
- The organization viewed RPA adoption as an enterprise-level objective rather than a siloed initiative among multiple business units across regional markets
- The organization implemented a hub and spoke governance model shared among the IT and business teams. A centralized engineering team worked on technology design
- The company was able to drive incremental business value, as employees were further trained on more business value-add items

# Enterprise journey 2 (page 1 of 2)

## Enabling themselves digitally and competing aggressively in the market were the key drivers behind this enterprise's RPA adoption journey

### The initiation of the enterprise's RPA journey

As a part of its digital strategy, RPA captured the attention of the enterprise's operational executives. RPA was specially noteworthy because the enterprise's back-end was being run on legacy systems, and RPA could promise the additional of digital to the legacy systems. The executives undertook research and conducted a competitive assessment of third-party automation vendors; they zeroed in on one vendor because of its AI capabilities and enterprise-wide licensing. The team strategized automation deployment around customer experience. A POC conducted with an automation vendor turned out to be promising in terms of returns and efficiency. RPA was viewed as an enterprise-level strategy rather than automation of siloed business units and processes.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>• Positioning the enterprise as a digitally-enabled firm that offers a best-in-class customer experience</li><li>• While cost reduction was a known benefit, it was never the driving objective behind RPA adoption</li><li>• Creating more insights around customer experience, for which chatbots and machine learning were chosen</li><li>• Reducing turnaround times more than the industry leader to gain significant competitive advantage</li></ul>	<ul style="list-style-type: none"><li>• Self-installation of robots without the support of a third-party vendor proved challenging. Ultimately, the vendor was called in to provide support, which helped the enterprise resolve issues</li><li>• Access authorization and security issues arose when the process was automated. Security vaults were needed to mitigate this concern</li><li>• Cultural issues surfaced when a team from different stakeholder representatives was formed</li></ul>

### Current status of the RPA program

**24-30** months since the automation journey was deployed

More than **2,000,000 transactions** automated to date

Achieved **60-70% accuracy** with chatbot operations

**Less than 80% STP** achieved in the automated process

## Enterprise journey 2 (page 2 of 2)

The cognizance of and investment in AI technologies, combined with RPA as an enterprise-level strategy, increased the enterprise’s realized benefits from automation adoption

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>• A successful POC with a third-party automation vendor helped drive the belief that RPA was the right investment. The organization undertook a detailed vendor assessment exercise to find and select a vendor with AI capabilities that was the right fit</li><li>• At the onset, automation was an enterprise-wide initiative, and thus enterprise-grade RPA tools were selected</li><li>• Machine learning was the next step and chatbots were deployed to gain deeper insights around customer experience</li></ul>	<ul style="list-style-type: none"><li>• The organization has achieved Straight Through Processing (STP) rates of 60-70% with automation and chatbots; this figure could increase to 80% if robots are optimized</li><li>• In one automated process, the number of people handling exceptions decreased from nine to one</li><li>• The time required for customer credentials verification for Vehicle and Asset Finance (VAF) reduced to less than 10 minutes</li><li>• The automation enabled the enterprise to increase its market share in a highly competitive environment</li></ul>

### Winning insights

- In order to achieve the full potential of automation, include leverage of AI in the planning stages, as it might impact automation vendor selection
- Benefits from RPA are significant only when automation is industrialized in the enterprise. Automating small processes, with lower volume of transactions, does not lead to full benefit realization. Enterprises should thus determine the feasibility of scalability before process/vendor/product selection
- A CoE pays off when scalability is required. While different business units might opt for different CoEs, they should have an integrated forum where they can share best practices with each other
- RPA should be owned by the business unit and supported by various other teams such as IT, risk and compliance, regulatory, and security. All the teams should be on the same page about governance
- Automation implementation should be based on agility, as faster response times are required when robots fail, otherwise customer experience delivery is negatively impacted

# Enterprise journey 3 (page 1 of 2)

A strong commitment to empowering employees to own automation from planning to production has accelerated this enterprise's RPA journey

## The initiation of the enterprise's RPA journey

This financial services enterprise launched its journey into RPA because it was regularly bogged down by the high variability and low predictability of volumes in their processes, which also led to increased hiring costs to manage seasonal peaks. From the onset, the enterprise built an RPA development and implementation knowledge base in-house and only leveraged a third-party RPA vendor for its robotics platform. The main vendor selection criterion was ease of use of the platform so that operations people could be trained easily on the technology and could lead the effort. The RPA vendor also was engaged to provide onsite consulting support to accelerate the enterprise's RPA learning.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>• Manage hiring costs and senior management's planning overload for processes with highly variable and unpredictable volumes</li><li>• Reduction in human errors as a financial services enterprises are very sensitive to these mistakes</li><li>• Improving employee skill sets as employees would be focusing more on judgment-intensive tasks following automation</li><li>• Manage cost and complexity with technology and also attract and retain technology-oriented customers</li></ul>	<ul style="list-style-type: none"><li>• Delaying the adoption of AI until after RPA reached maturity was later realized to be a mistake</li><li>• Choosing a complex process as the initial one to automate delayed production as it took eight months to automate the selected process</li><li>• Security concerns arose when access to robots needed to be granted, especially because the enterprise is in the financial services space. All the robots are thus assisted at all times</li></ul>

## Current status of the RPA program

**Over 4 years** since the automation journey was initiated

**Machine learning** deployed last year; first process in production

Approximately **3,000 software robots** deployed across multiple centers

**15-20% productivity increase** with AI

# Enterprise journey 3 (page 2 of 2)

An objective-driven approach to planning for automation has worked well for this enterprise, which applied a phased approach to process automation to quickly realize cost objectives

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>• The enterprise decided to become self-sufficient in terms of RPA knowledge at the beginning of its journey and trained its own employees on RPA development and implementation</li><li>• While program governance is centralized, operations and deployments are now decentralized as there is variation across centers</li><li>• The enterprise has designed a standardized framework for computing process/use-case feasibility</li><li>• To accelerate benefits, the enterprise selectively applied automation to simpler processes quickly and then fixing broken processes before automating</li><li>• The organization used a dedicated team for RPA development and maintenance</li></ul>	<ul style="list-style-type: none"><li>• Manageability of volume fluctuations increased</li><li>• Employee productivity improved and employees ability to add value increased</li><li>• Cost-savings of approximately 40% for simpler processes</li><li>• Reduction in delivery time for the end-customer</li></ul>

## Winning insights

- Enterprises should be clear on the outcomes they want to achieve with RPA and AI deployments, as their planning is heavily dependent on the outcomes desired
- As enterprises transfer more planning, implementation, and deployment into the hands of employees, RPA rapidly pervades the organization. People are excited about RPA when they are involved first-hand
- Always have a target process picture before trying to automate. Automating processes in their current state could create significant challenges when enterprises are trying to scale up. Also, processes could be automated in phases – automating the standard parts first and then moving on to complex pieces
- Involving people in the entire RPA journey significantly diminishes the change management effort required
- Enterprises generally have a significant amount of reusable code; this code should be easily accessible to help spread RPA to other business units with minimal additional effort

# Enterprise journey 4 (page 1 of 2)

The enterprise embarked on a Smart RPA journey to achieve benefits today and in future

## The initiation of the enterprise’s RPA journey

This UK-based motor insurance company initially used only one robot. The CEO believed that investment in RPA could yield increased cost-savings and enhanced efficiency. The company built a simple flow within the first two weeks, taking into consideration the initial resources available. This project’s goal was to help people realize what RPA could do and create excitement. The enterprise decided to use a POC, which provided a guideline for the IT infrastructure needed. Eventually, the necessary infrastructure was set up by getting a buy-in from various teams by creating a dedicated automation team, comprising smart business people with the right aptitude and inclination toward technology with appropriate training to build robots. The automation team provides shared services and forms part of a centralized CoE.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>• Exploring all that software robots could do</li><li>• Making departments more efficient and, thus, save cost</li><li>• Reducing transactional work for employees and replace them with more strategic and value-added tasks</li><li>• Adding value to the business, which should yield output today and, to a greater extent, in the future</li></ul>	<ul style="list-style-type: none"><li>• There were some apprehensions regarding robot output at the start of the project</li><li>• Getting the much needed infrastructure for implementation</li><li>• The rate of transformation was quite fast, and other teams/businesses were dependent too, which created additional pressure at times of failure</li><li>• Debugging the causes of robot failures was sometimes difficult and frustrating for the IT department</li></ul>

## Current status of the RPA program

**Over 2 years** since the automation journey was initiated

**60 RPA licenses** in production

Leveraging **Intelligent OCR / IDP** and RPA for higher automation rates

**75% robot licenses** being utilized on a daily basis

Exploring **process mining** technologies to find the gap in processes and speed deployments

# Enterprise journey 4 (page 2 of 2)

A careful selection of processes for automation, stakeholder alignment, and in-house automation team led to substantial cost savings and quick payback

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>• All the relevant stakeholders were brought onto the RPA initiative and the resistance pertaining to the robots' output was overcome, leading to a sustainable RPA implementation journey</li><li>• Setting up the necessary IT infrastructure for the implementation was a key factor that influenced the process in multiple ways</li><li>• The automation team was developed in-house, primarily by identifying relevant people from within the organization and training them</li><li>• The governance system, and the development and maintenance of robots, are centralized through a CoE</li></ul>	<ul style="list-style-type: none"><li>• Considerable functional cost savings through the robots being put in use</li><li>• Saved 20,000 FTE hours per month using RPA</li><li>• Achieved a payback of its initial investment within seven to eight months of the start</li><li>• Employee engagement improved as their work transitioned from repetitive transactional tasks to focus more on judgment-intensive skills development</li><li>• About 50% higher automation rates achieved in content-centric processes by leveraging IDP along with RPA</li></ul>

## Winning insights

- The POC should not be a starting point; rather the focus should be on mapping all the infrastructure and IT facilities needed. It is incorrect to presume that it would take time for processing and implementation, because the pace increases with time and the impact is huge
- Maintain a close contact with all the stakeholders and, most importantly, explain the key benefits of the new technology and its usage to prevent negative perceptions from setting in
- Construct and implement a framework to look at every process before sending it for production; do not automate a bad process. Processes should be revisited or if necessary, redesigned entirely, before automating
- Process mining technologies can help analyse process gaps and optimize them before going into production
- Change the name of the CoE from robotics to automation to proactively avoid any negative connotation
- The team should comprise smart people who have the necessary aptitude and inclination toward technology

# Enterprise journey 5 (page 1 of 2)

With its eyes set on transforming operations for the future, this enterprise developed robust governance and project management mechanisms to build RPA

## The initiation of the enterprise’s RPA journey

For this technology products-focused company, RPA was born within the finance department. Budgetary constraints around finance operations led to the enterprise contemplating RPA and establishing a finance innovation practice to transform the enterprise’s finance operations into finance of the future. Early on, the enterprise decided not to leverage System Integrators (SIs) for implementation and created a robust governance structure in-house, operating from feasibility judgment to production and ongoing robot maintenance. The first selected process for automation was more about testing the RPA waters, which gave the enterprise the confidence to target potential scalable use cases.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>● Getting business insights from the substantial amount of data going unleveraged in the organization</li><li>● Increasing process efficiency and transforming operations to be future-ready</li><li>● Inculcating new skills in employees, thus elevating their career trajectories and engagement</li></ul>	<ul style="list-style-type: none"><li>● Getting all stakeholders on board and aligned</li><li>● Selecting and prioritizing projects</li><li>● Striking the right balance between automating as-is versus optimizing and redesigning processes before automating</li></ul>

## Current status of the RPA program

**Around 2 years** since the automation journey was initiated

**CoE with global presence**  
and <100 people

**OCR, blockchain, and machine learning** are the next targeted set of technologies

# Enterprise journey 5 (page 2 of 2)

The enterprise derived various tangible and intangible benefits from its RPA implementation and is now targeting end-to-end rather than point solutions by leveraging AI

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>Processes with high headcount and heavy transaction volume were identified as the best potential targets for automation</li><li>Partnership with IT was decided up front. The IT team was a part of implementation at various points such as vendor review and selection. The role of IT was clearly defined. While the operations team led the RPA initiative, IT played a supporting role</li><li>For identification of attractive targets, the operations team and quality resources were involved as they have deeper knowledge of the process</li><li>After attaining a specified level of maturity in RPA in the finance department, the business unit moved to integrate RPA with more cognitive capabilities and analytics to capture business intelligence</li></ul>	<ul style="list-style-type: none"><li>Tangible benefits include direct cost savings through headcount reduction and hiring avoidance</li><li>Many intangible benefits such as better compliance and risk management, greater employee engagement, and more valuable employee skillsets</li><li>High conversion rates of ~80% for identified processes into automation implementations</li></ul>

## Winning insights

- Complete centralization of RPA implementations would not be feasible for various enterprises. Such organizations should thus decide the distribution of implementation activities
- Governance structure is a key decision that the enterprise should tackle early on in their journey. A steering committee that would prioritize and drive the projects should be set up. Business units consisting of various sub departments should have SPOCs to bring attractive projects to the table
- All projects should be funneled through a standard prioritization framework because budgetary constraints mean that all identified target projects will not ultimately be automated
- AI starts playing a significant role when enterprises move toward end-to-end process automation versus point solutions with basic RPA
- Initial planning should definitely take into consideration the future scalability required

# Enterprise journey 6 (page 1 of 2)

The CEO of this enterprise started its Smart RPA journey due to his confidence in the RPA potential and wanted the best people to work on it

## The initiation of the enterprise’s RPA journey

This Life and Pensions (L&P) insurer’s CEO first believed that RPA could be a high-potential investment that would introduce cost savings and efficiency. Every department was given a cost savings target, and they were free to choose the methodology they found more suitable. Many were inclined toward RPA, and that is how RPA entered into this organization. However, the enterprise believed that RPA development with businesspeople and without IT would be messy and inefficient. They thus have dedicated RPA developers from the IT department. The role of the IT department also expands to the business side where IT, along with business, does requirement planning according to the processes to be automated.

Objectives behind RPA adoption	Challenges
<ul style="list-style-type: none"><li>• Making the departments more efficient and thus save costs</li><li>• Transferring mundane transactional work from employees and transitioning them to more business value-add tasks</li><li>• Getting operational analytical insights from automation logs. RPA vendor logs are not suitable for this purpose as they are complex and can only be used for debugging by IT people</li></ul>	<ul style="list-style-type: none"><li>• Debugging the causes of robot failures was sometimes very difficult for the IT department. The robots usually work on third-party tools, and they can fail if any tools are updated or fail. Sometimes the updates to the UI were so negligible that it was hard to distinguish the cause of robot failure</li><li>• When robot failures happened, the developer had to put in extra effort to get them running</li></ul>

## Current status of the RPA program

**Around 2.5 years** since the automation journey was initiated

**53 unique processes** automated and over

**1.5 million** items completed using robots

**7 robot licenses** in production

**40 FTEs** worth of mundane work being saved using robots

# Enterprise journey 6 (page 2 of 2)

Ensuring extensive usage of robotic resources and the enterprise’s IT and security infrastructure greatly increased this enterprise’s realized RPA benefits

Strategy and approach	Key business outcomes achieved
<ul style="list-style-type: none"><li>Stakeholders had to be brought onboard the RPA initiative, and the first stakeholders to be onboarded were those who hold the budget and would ultimately decide to spend on RPA. After that, IT was onboarded which was crucial, as IT was to lead the robotic development</li><li>Reusing the underlying security infrastructure and treating the robots only as virtual FTEs with the same security restrictions made it easier to engage the security team</li><li>The robot code was reused to ensure that the amount of automated processes configured is the minimized while robotic work is maximized, leading to lower robot maintenance requirements</li><li>Development and maintenance of robots is centralized</li></ul>	<ul style="list-style-type: none"><li>Cost savings achieved through headcount reduction was more than initially targeted by the business units</li><li>Employee engagement improved as they were moved away from repetitive transactional tasks to focus more on judgment-intensive skills development</li><li>Analytical insights for senior leadership are derived from the robotic data, helping management fuel their strategic initiatives while extracting best practices from other well-performing departments</li></ul>

## Winning insights

- Robotic development and the underlying coding should be as dynamic and agile as possible. As standards change, standards should be developed in an agile manner. Also, static verification of robot code should be undertaken to filter out any fixed parameters in the code that may reduce a robot’s accuracy during the production
- Robot testing should be as robust as possible because, when a robot goes into production and then fails, it is difficult for developers to debug and correct
- Avoid over-engineering. For some enterprises, it might be helpful to quickly launch themselves into robot production and then learn from their mistakes, retroactively correcting them, and then keep scaling them up
- Complete reliance on the business team for robot development should be avoided as business people might not be well-suited to understand the deeper technical aspects, such as when robots fail
- Optimize license usage as much as possible by reusing similar robots across different departments. Also, try to reuse the already available IT and security infrastructure to minimize additional investments

# Everest Group organizes capabilities according to five key components of enterprises' Smart RPA journey

## Journey components

## Key focus areas

### Vision & strategy

- To understand the vision of the organization for Smart RPA and the drivers behind its adoption
- To assess the organization's readiness for Smart RPA adoption from a process, risk, and security perspective

### Implementation

- To assess the scale and scope of Smart RPA adoption along with the pace at which Smart RPA has been adopted – in terms of software robots deployed and time taken to scale up from pilots

### Organization & talent

- To assess the governance model for Smart RPA and extent of collaboration between the implementing groups
- To analyze the talent management strategy for the organizational change as a result of Smart RPA adoption

### Technology

- To assess the extent to which various different components of Smart RPA technologies, such as process mining, computer vision, and chatbots, are being developed
- To assess the level of sophistication of various Smart RPA technologies deployed

### Resourcing

- To assess the sourcing strategy, training, and education programs for various Smart RPA skills

# Enterprise Smart RPA capability is assessed across over 30 capability elements (page 1 of 2)

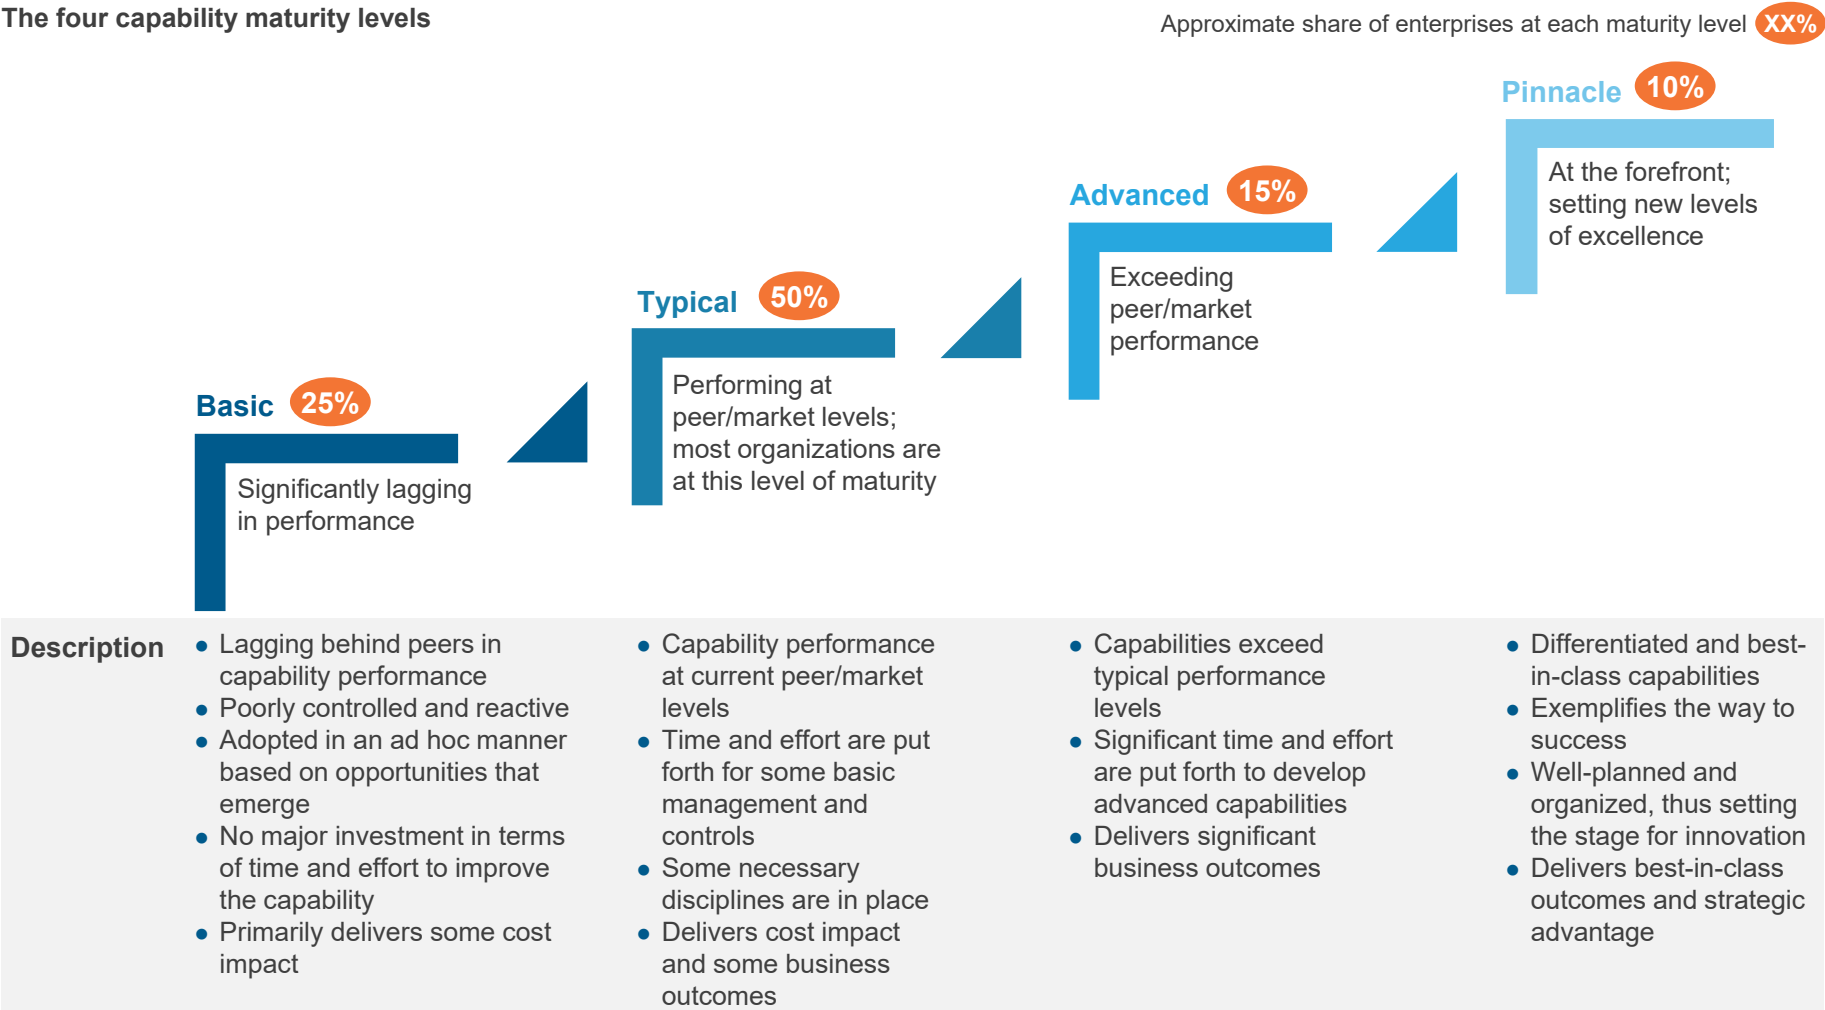

Journey components	Capability elements
<p><b>A. Vision &amp; strategy</b> (10 capabilities)</p> 	<ul style="list-style-type: none"> <li>A1. Primary drivers of Smart RPA adoption</li> <li>A2. Funding/sponsorship</li> <li>A3. # Enterprise Smart RPA capability is assessed across four maturity levels

The four capability maturity levels

Source: Everest Group (2018)

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
A. Vision & strategy	Primary drivers of Smart RPA adoption	Business case focused on generating quick cost savings	Business case focused on increasing productivity, efficiency, and quality, or address specific tactical requirements (such as backlog of cases to process) along with generating cost savings	Business case is focused on improving regulatory compliance, employee experience, and customer experience along with increasing productivity, efficiency, and quality as well as generating cost savings	Business case is focused on disrupting the market, innovating the business model, and growing revenue in addition to improving regulatory compliance and customer experience and increasing productivity, efficiency, and quality along with generating cost savings
	Funding/ sponsorship	Primarily sponsored/funded by local/regional business unit budget	Primarily sponsored/ funded by the global shared services budget	Primarily sponsored/ funded by global business function's budget	Primarily funded by the central enterprise budget; sponsorship from CXO

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
A. Vision & strategy	Project initiation	Siloed approach with no CoE support	Projects are initiated by global shared services OR local/regional business units with limited CoE support	Projects are initiated by global business functions OR global shared services OR local/regional business units; multi-pronged approach with substantial CoE support	Projects are initiated by corporate OR global business functions OR global shared services OR local/regional business units; multi-pronged approach with robust CoE support
	IT alignment	Led by operations/ business team with very limited support from IT	Led by operations/ business teams and supported by local IT teams	Enterprise IT is brought on board to set standards and support security, infrastructure, and business continuity requirements; revising standards and practices to reflect the fact that users are now going to include non-humans or virtual agents (such as two factor authentication)	Enterprise IT is an end-to-end partner for all Smart RPA initiatives for setting standards and supporting security, infrastructure, and business continuity; enhancing and revising standards and practices to reflect the fact that users are now going to include non-humans or virtual agents (such as two factor authentication)

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
A. Vision & strategy	Security and risk preparedness for Smart RPA	No major changes made to security and risk policies and worked around existing ones to accommodate changes required for Smart RPA projects	Some changes to security and risk policies were made to accommodate Smart RPA environments and scenarios	Proactively evaluated and planned for mitigation of security and compliance risks associated with Smart RPA initiatives; set up unique risk management protocols and controls for RPA and/or AI deployments	Included security and risk leaders in Smart RPA evaluation and Smart RPA projects to prepare, manage, and mitigate associated security, risk, and compliance requirements unique and essential for RPA and AI deployments; redefined security and risk policies and set up robust set of protocols, which are regularly monitored and optimized

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
A. Vision & strategy	Security and risk preparedness for Smart RPA (factors considered)	Active directory integration, audit trail for RPA or AI, and infrastructure and system requirements	Roles-based user access, secure credential vault, active directory integration, audit trail for RPA or AI, data protection and privacy, infrastructure and system requirements, loading speed of applications, and compliance requirements	Ensuring solid governance of AI decision-making, full audit trail of robot actions, user access for robots, unique firewall, active directory integration, roles-based user access, integration with specialized secure credential vault, data protection and privacy, infrastructure and system requirements, loading speed of the applications, and strict compliance requirements	Assigning granular user access controls to robots, ensuring solid governance of AI decision-making, user access for robots, unique firewall, active directory integration, roles-based user access, integration with specialized secure credential vault, data protection and privacy, infrastructure and system requirements, loading speed of the applications, and strict compliance requirements

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
<b>A. Vision &amp; strategy</b>	Metrics and KPIs for measuring benefits/ impact of Smart RPA (such as cost savings, ROI, process quality and speed, productivity, customer experience, revenue growth, and time-to-market)	The organization currently does not use any well-defined metrics to measure returns from Smart RPA investments; metrics used are ad hoc, poorly controlled, and reactive/chaotic	Some basic cost and efficiency metrics / existing IT metrics, which are repeatable in projects, are used to measure returns from Smart RPA investments	The organization has defined a series of new metrics (customer experience, efficiency, cost, etc.), roles, and responsibilities that are standardized across the organization to track the returns on Smart RPA investments	The organization continuously optimizes the metrics (revenue growth, time-to-market, customer experience, efficiency, cost, etc.) and roles and responsibilities to measure and optimize impact of Smart RPA investments

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
<b>A. Vision &amp; strategy</b>	Metrics and KPIs for measuring the effectiveness of Smart RPA initiatives (such as efficiency of automation codes and algorithms, reusability of codes, infrastructure utilization, license utilization, speed of automation/ implementation, STP rate, number of robots, and number of transactions/tasks automated)	The organization currently does not use any well-defined metrics to measure effectiveness of Smart RPA initiatives; metrics used are ad hoc, poorly controlled, and reactive/chaotic	Some basic metrics / existing IT metrics, that are repeatable in projects, are used to measure the effectiveness of Smart RPA initiatives; metrics such as the number of robots and the number of transactions/tasks automated	The organization has defined a series of new metrics, roles, and responsibilities that are standardized across the organization to track and measure the effectiveness of Smart RPA initiatives as well as defined policies, procedures, and practices driven by flexibility to accommodate unique aspects of different business units; metrics such as infrastructure utilization, license utilization, speed of automation/ implementation, STP rate, number of robots, and number of transactions/tasks automated	The organization continuously optimizes the metrics, policies, procedures, practices, roles, and responsibilities to measure and optimize the effectiveness of Smart RPA initiatives; metrics such as efficiency of automation codes and algorithms, extent of reusability of assets, GPU usage, infrastructure utilization, license utilization, speed of automation/ implementation, STP rate, number of robots, and number of transactions/tasks automated

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
A. Vision & strategy	Targeted process types for Smart RPA adoption	Simple processes; transactional, rules-based tasks with structured data flow (data in enterprise databases, well-organized data sets in excel workbooks, etc.)	Content-centric processes and simple processes; transactional, rules-based tasks with significant semi-structured data flow (such as documents such as PDF, email, word, and scans without much variance in templates)	Customer-centric processes and content-centric processes and simple processes; high volume, judgement-based, interactive tasks with unstructured data flow (chat, voice, data from social media, etc.)	Domain-centric processes and customer-centric processes and content-centric processes and simple processes; highly judgment-based / decision-making tasks requiring critical thinking (such as large multi-page documents such as legal contracts, handwritten documents, and checks)
	Changes to business processes for Smart RPA adoption	No meaningful changes to business processes	Significant changes to a few business processes	Simplified and reengineered business processes to leverage Smart RPA initiatives	Defined future state for all business processes and then reengineered business processes

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
<b>B. Organization &amp; talent</b>	Smart RPA team structure	No dedicated Smart RPA team within the organization	Decentralized Smart RPA operations; each business unit has its own Smart RPA team	Centralized Smart RPA team that defines and implements Smart RPA initiatives for the entire organization	Hybrid Smart RPA operations; decentralized Smart RPA teams from business units work closely with a central team to implement Smart RPA initiatives
	Type of Smart RPA CoE	No formal CoE set up for Smart RPA initiatives	Specialized CoE for some specific Smart RPA initiatives	Centralized Smart RPA COE for all Smart RPA projects	Hub and spoke Smart RPA CoE model with a presence across business units
	Scope of the Smart RPA CoE	Less than 40% of Smart RPA projects are governed by the CoE	Around 40-60% of the Smart RPA projects are governed by the CoE	About 60-80% of the Smart RPA projects are governed by the COE	More than 80% of the Smart RPA projects are governed by the CoE
	Sharing/pooling of Smart RPA skills	No sharing/pooling of Smart RPA skills	Sharing/pooling of Smart RPA skills within regional business units/functions	Sharing/pooling of Smart RPA skills within business functions across geographies	Organization-wide sharing/pooling of Smart RPA skills across most Smart RPA initiatives across most business functions and geographies

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
<b>B. Organization &amp; talent</b>	Roles and responsibilities of the CoE	Drive the roll-out and implementation of Smart RPA projects and ensure coordinated communication with relevant stakeholders; loosely defined roles, responsibilities, and skill sets required	Ensuring quality and compliance through well-defined standards, procedures, and guidelines, owned and developed by the CoE; drive the roll-out and implementation of Smart RPA projects and ensure coordinated communication with relevant stakeholders; some key roles and responsibilities are well-defined	Approves all automation procedures before they are put into production, assesses suitability of Smart RPA vs. other Smart IT tools for use cases and ensures quality and compliance through well-defined standards, procedures, and guidelines, owned and developed by the COE; drives the roll-out and implementation of Smart RPA projects, and ensures coordinated communication with relevant stakeholders; well-defined roles, responsibilities, and skills sets required	Smart RPA training and education program to develop talent and approves all automation procedures before they are put into production, assesses suitability of Smart RPA vs. other Smart IT tools for use cases and ensures quality and compliance through well-defined standards, procedures and guidelines owned and developed by the COE. Drives the roll-out and implementation of Smart RPA projects, and ensures coordinated communication with relevant stakeholders; well-defined roles, responsibilities, and skills sets required that are regularly reviewed and optimized

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
B. Organization & talent	Reusability of automations	Does not have a library of reusable automations	Has developed libraries of reusable automations but does not share it with other business units / regions	Developed libraries of reusable automations are shared across some business units / regions	Developed a central library of reusable automations that are shared across the organization globally
	Primary use of process data from automations	Monitoring performance of automation assets and applications	Monitors utilization of available resources, refines/updates automated workflows to reduce exceptions, and collects training data for AI	Finds gaps in existing processes to optimize/re-engineer/streamline them and make them more efficient	Predicts future trends in demand and customer behavior to develop/refine future capacity planning / business strategies
	Focus on tracking/optimizing the effectiveness of the program	Collection and usage of performance data are ad hoc, sporadic, and uncoordinated	Performance data is regularly (monthly/weekly) collected to produce reports and dashboards with some useful information	Performance is monitored in real-time and performance data is collected and used in a coordinated fashion to gain new insights that improve operational decision-making	Performance is monitored in real-time and performance data is collected and used in a coordinated fashion to make operational and strategic decisions and develop strategic foresight and predictions for the future

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
B. Organization & talent	Focus on tracking/optimizing the benefits achieved	Collection and usage of impact data are ad hoc, sporadic, and uncoordinated	Impact data is regularly (quarterly) collected to produce reports and dashboards with some useful information	Impact data is regularly (monthly) collected and used in a coordinated fashion to gain new insights that improve operational decision-making	Impact data is regularly collected/monitored 24X7 and used in a coordinated fashion to make strategic and operational decisions as well as to develop strategic foresight and predictions for the future
	Level of employee engagement	Few people proactively engaging in some of the Smart RPA initiatives	More believers who engage in Smart RPA initiatives	Organization-wide employee engagement; some internal experts to facilitate engagement; developing culture of innovation and design thinking	Front-end to the CoE constituting internal experts, set up across the organization for employee experience and engagement; rewards system for contribution; integrated culture of innovation and design thinking

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
B. Organization & talent	Availability of training/learning and awareness programs	Limited training and awareness programs	Informal structure; external training/learning; awareness programs made available to a focused group of stakeholders	Formal structure; external/customized training to reskill/upskill resources and provide alternate career paths; organization-wide education and awareness programs	Organization-wide, integrated, and specialized internal training, education, and awareness programs to reskill/upskill resources, provide alternate career paths, educate stakeholders on capabilities and benefits of Smart RPA, and proactively address concerns around technology
	Nature of impact on employees	No attempt to redeploy/reskill/upskill employees released due to Smart RPA initiatives	Modest attempts made to redeploy employees released due to Smart RPA initiatives in other areas (such as minimal investment and management commitment)	Significant attempts made to reskill and redeploy employees released due to Smart RPA initiatives by providing alternate career paths (such as education program set up for reskilling)	Significant attempts made to reskill/upskill employees released due to Smart RPA initiatives to do higher value work and provide alternate career paths (for example education program set up for reskilling and upskilling)

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
C. Technology	RPA	Primarily attended RPA/RDA; ad hoc integration with collaborative technologies	Attended RPA/RDA and unattended RPA to batch process tasks; basic integration with collaborative technologies	Autonomous RPA with human-in-the-loop for real-time exception handling and user interaction; integrated with most of the collaborative technologies and enterprise applications	RPA-as-a-service; autonomous RPA with human-in-the-loop for real-time exception handling and user interaction; seamless integration with collaborative technologies and enterprise applications
	Pre-built, reusable templates and automations from vendors, service providers, or marketplaces	None	Process-/industry-neutral templates and automation activities/subtasks (for example login, logout, and currency conversion)	Horizontal function-specific templates and automation assets (F&A, HR, CXM, etc.) and process-/industry-neutral templates and automation activities/sub-tasks (for example login, logout, and currency conversion)	Industry vertical-specific templates and automation assets (for example KYC/AML, claims processing) and horizontal function-specific templates and automation assets (F&A, HR, CXM, etc.) and process-/industry-neutral templates and automation activities/sub-tasks (for example login, logout, and currency conversion)

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
C. Technology	OCR / computer vision	Basic OCR for digitizing content; typed text	OCR and ML and rules; document classification, data capture, and extraction using machine learning, template-based rules, and validation; block letters (typed or handwritten)	OCR and auto ML and NLP; document classification, data capture, and extraction using real-time/active learning, auto ML, NLP, intent analysis, rules, and validation; block letters (typed or handwritten)	OCR and domain ontology and Deep Learning and auto ML and NLP; document classification, data capture, and extraction using real-time/active learning, auto ML, NLP, intent analysis, rules, and validation; cursive writing with good level of accuracy
	Analytics	Reporting analytics	Descriptive analytics (reporting)	Predictive analytics (reporting and descriptive)	Prescriptive analytics (reporting, descriptive and predictive)
	Chatbots	Simple, rules-based	Rules-based and text analysis	ML and NLP and sentiment analysis and emotional analysis and next-best-action	Deep learning and auto ML and NLP and sentiment analysis emotional analysis and contextual and domain ontology

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
C. Technology	Process orchestrator / BPM	Do not use any central orchestrator / BPM; manual orchestration	Central orchestrator for unattended RPA tasks	Central orchestrator for all types of RPA (attended / unattended / human-in-the-loop) and exception handling tasks; API integration with a third-party BPM tool (for example, API enables the BPM to trigger robots); intelligent workload balancing	Central orchestrator / BPM (process orchestrator technology that combines the functionality of RPA orchestration and BPM) for end-to-end processes across RPA, system, and human tasks; seamless/robust integration with a third party BPM tool where BPM can interact with robot just the same way as the orchestrator does (for example, having real-time status); intelligent workload balancing
	Hosting type	Physical, desktop-based	On-premise server-based	Private cloud-based, hybrid	Public cloud-based, hybrid
	Process mining	Do not use any process mining tool	Captures/discovers desktop processes	Identifies gaps in the captured processes	Optimizes the captured processes

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
D. Resourcing	Sourcing of Smart RPA talent	Leveraging existing resources with limited training and Smart RPA skills	External/third-party resources and leverages existing resources with limited training and Smart RPA skills	New hires and external/third-party resources	Reskilled/upskilled resources with well-structured Smart RPA training and new hires and external/third-party resources
	Smart RPA training and education	No formalized Smart RPA training and education program	External Smart RPA training by vendors / service providers	Well-structured Smart RPA internal training program; primarily for RPA skills	Integrated Smart RPA training and education programs that are continuously reviewed and optimized; for RPA and AI / data science skills

# Enterprise Smart RPA capability maturity model

Enterprise Smart RPA capability maturity model					
Journey components	Capability elements	Basic	Typical	Advanced	Pinnacle
<b>E. Implementation (scale, scope, and speed)</b>	Distribution of Smart RPA projects by stage	Most of the Smart RPA projects are in the planning or piloting stage	Most of the Smart RPA projects are in the pilot stage	Most of the Smart RPA projects are being scaled up from pilots	Most of the Smart RPA projects are in steady-state implementation stage
	Scale of Smart RPA adoption	Less than 10% of potential tasks/ transactions have been automated or fewer than 10 processes	Around 10-30% of potential tasks/ transactions have been automated or five to 20 processes	30-60% of potential tasks/transactions have been automated or 20 to 100 processes	More than 60% of potential tasks/ transactions have been automated or more than 100 processes
	Scope of Smart RPA deployments across functions	One business function	Two to three business functions	Four to five business functions	More than six business functions
	Speed of Smart RPA adoption	Up to five RPA robots/licenses per quarter on an average	Six to 15 RPA robots/licenses per quarter on an average	16 to 25 RPA robots/licenses per quarter on an average	More than 25 RPA robots/licenses per quarter on an average

- Enterprise Smart RPA journey
- Accelerating the Smart RPA journey
- Enterprise case studies
- Pinnacle Enterprises™ Smart RPA maturity model
  - Assessment of Smart RPA capability maturity
  - **Assessment of Smart RPA outcomes**
- Developing the business case for Smart RPA
- Appendix

# Pinnacle Enterprises™ Smart RPA outcomes model helps understand your current state and goals for the desired target state

- Overall, outcome is measured through a combination of three factors: cost impact, operational impact, and business impact
- Each of these are further broken down into sub-dimensions that fall into one of three buckets depending on the level of outcome achieved. The exact measure of outcomes will vary significantly by the portfolio of processes being automated

# Enterprise Smart RPA outcomes can be assessed across over multiple elements

Impact dimensions	Sub dimensions
<b>A. Business impact</b>	A1. Improving customer experience A2. Creating new business models A3. Decreasing time-to-market for new and innovative products and services A4. Process transformation and design thinking A4. Improving employee experience
<b>B. Operational impact</b>	B1. Increase in process accuracy B2. Reduction in process cycle time B3. Improvement in staff productivity B4. Improvement in SLA compliance
<b>C. Cost impact</b>	C1. Return On Investment (ROI) from Smart RPA initiatives C2. Capacity enhancement from Smart RPA C3. Time taken to achieve ROI from Smart RPA initiatives C4. Cost reduction and cost avoidance from Smart RPA (extent of improvement over pre-RPA scenario)

- Pinnacle Enterprises™ Smart RPA maturity model
- **Developing the business case for Smart RPA**
  - **Key assumptions and framework for assessment**
  - Aggregated business case for an enterprise
  - Business case for front-office operations
  - Business case for back-office operations – F&A
  - Business case for back-office operations – P&C insurance processes
- Appendix

# Key assumptions and assessment framework (page 1 of 3)

## Operating model

- We have considered a P&C insurance enterprise that leverages onshore and offshore locations for delivery. The delivery pyramid is offshore-heavy at the bottom and onshore-heavy at the top
- Cost savings from offshoring/outsourcing are already realized, and these benefits are not considered in this analysis

## Scale

- The enterprise generates US\$10 billion in revenue with 5,500 FTEs across front-office (contact center), back-office (finance & accounting), and insurance-specific back-office processes
- The enterprise's volume of work post-RPA is the same as pre-RPA
- For this assessment, we have considered that FTEs impacted by Smart RPA have been appropriately redeployed across other functional areas within the enterprise, and their associated costs have been excluded from the operating costs for delivery after RPA implementation

## Process mix and delivery pyramid

- Contact center, F&A, and insurance-specific FTEs are appropriately distributed among transactional and judgment-intensive processes with typical potential extent of automation
- A typical employee pyramid has been considered, which factors in the variation in talent mix before and after RPA implementation

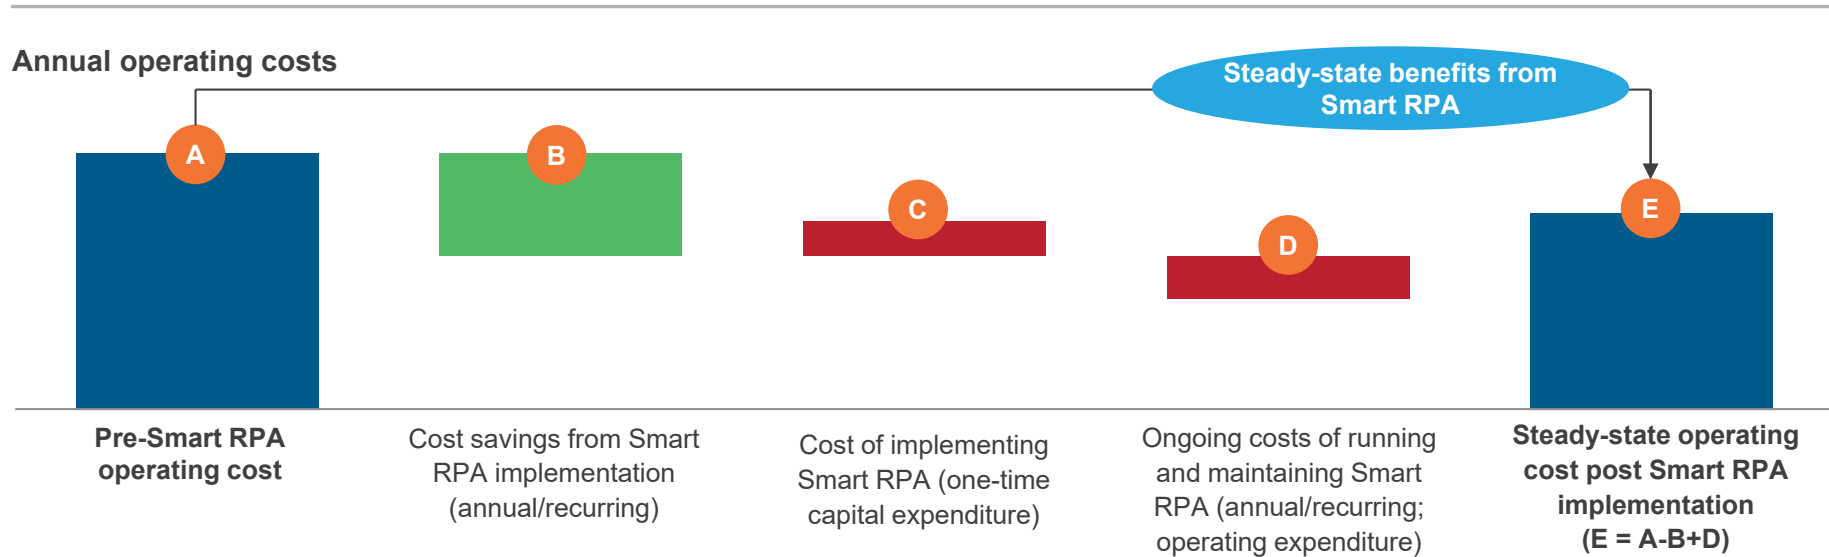

## Quantified benefits

- We have taken into account the cost benefits through savings on:
- People costs due to headcount saved, hiring avoidance, and productivity improvement
  - Non-people costs such as infrastructure, hiring, and new employee onboarding and training costs

## Unquantified benefits

- Benefits from Smart RPA deployments such as improvement in process quality and speed, customer experience, governance and compliance, time-to-market for new products and services, and top-line growth have not been quantified for this analysis

# Key assumptions and assessment framework (page 2 of 3)

- We have assumed a flat business case, in other words, pre-Smart RPA operating costs are assumed to remain constant. Ideally this would increase year-over-year due to salary increments, inflation, etc.
- Costs and savings realized are risk- and present value-adjusted for the ROI calculation
  - **Risk adjustment:** To account for potential risks of Smart RPA projects, such as slower project roll-out and benefit realization, change management, the greenfield nature of the technology, etc., savings have been adjusted down by 10%, and implementation and ongoing maintenance costs have been adjusted up by 15%
  - **Present value adjustment:** A yearly discount rate of 10% has been assumed to calculate the present value or current value of the costs

# Key assumptions and assessment framework (page 3 of 3)

## Description of cost components Smart RPA deployment

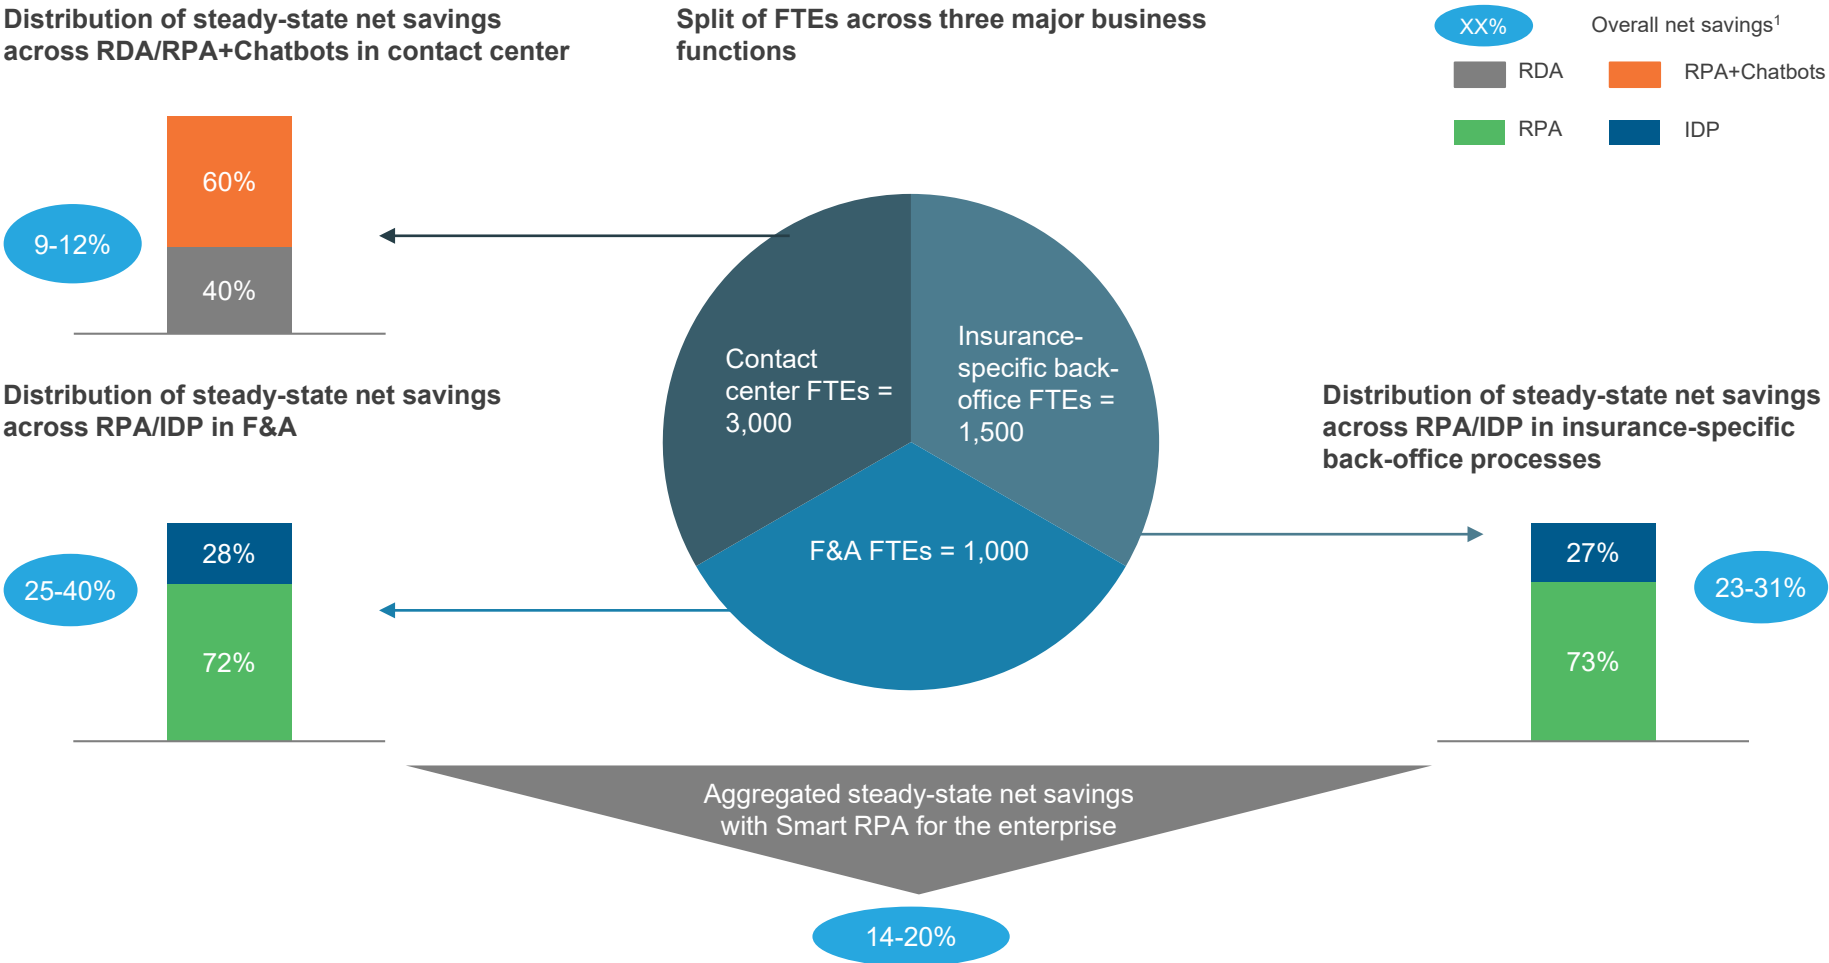

Cost components		Cost description
Capital expenditure (one-time costs)	Initial costs	Cost of planning, business case development, vendor selection, conducting POC, training, CoE enablement, support for initial implementation, etc. The cost is evenly distributed over the first two quarters of the Smart RPA journey
	Deployment/implementation cost	Cost of use case identification, development, environment set-up, testing, deployment, etc. One-time cash outlay, spread over the implementation period until steady-state is achieved
Operating expenditure (annual/recurring costs)	Software licensing cost	Ongoing cost of software, whether RDA (attended RPA), unattended RPA, IDP, or chatbot
	Hosting – virtual desktop cost	Ongoing cost of hosting RPA on a virtual desktop incurred in proportion to the number of RPA licenses deployed
	Hosting – central server cost	Ongoing cost of a central server for hosting RPA and IDP incurred once every year cumulatively for RPA and IDP
	Monitoring and maintenance cost	Ongoing cost of solution maintenance, monitoring, etc., incurred every quarter before and after the deployments reach steady-state

# Business case at an enterprise level for a P&C insurer that has deployed Smart RPA solutions in contact center, F&A, and insurance-specific operations

1 Net savings shown are for Smart RPA projects in steady state and are computed as the cost of running and maintenance of Smart RPA technologies subtracted from the gross people and non-people costs savings when Smart RPA is at its full potential

Source: Everest Group (2018)

# Aggregated payback period analysis for Smart RPA in a P&C insurance enterprise

Time-to-value realization

- The payback period analysis for an actual enterprise could vary depending on multiple factors related to an organization's readiness for Smart RPA such as the extent of digitization and standardization of processes automated
- We have assumed an initial planning period of three months for business case development, vendor selection, conducting a POC, identifying targets for initial implementation, setting up the environment for initial implementation, etc.
- While RPA generates 100% savings in the next quarter of deployments, savings from AI are cumulatively spread across multiple quarters due to a learning period involved for AI to realize its full potential (until it reaches saturation)

Source: Everest Group (2018)

# Smart RPA could deliver a risk-adjusted ROI of over 200% over a three-year period

## Quantitative analysis of risk-adjusted ROI for Smart RPA

All figures in US\$000s

Year	Year 1		Year 2		Year 3	
Impact	Low	High	Low	High	Low	High
Total cost of automation	4,179	4,639	5,657	6,436	5,247	6,066
Risk-adjusted present values of costs	4,065	4,513	4,909	5,585	4,061	4,694
Savings realized	4,645	6,292	16,869	23,380	27,898	38,744
Risk-adjusted present values of savings	3,800	5,148	12,547	17,390	18,864	26,198
<b>Risk-adjusted ROI for a 3-year term</b>	$= \frac{(\text{sum of PVs of (savings - costs)})}{(\text{sum of PVs of costs})}$			=	~170 to 220%	

## Key assumptions

- Total cost of automation and savings realized are cumulatively computed across contact center, F&A, and back-office insurance departments for a US\$10 billion P&C insurer. Benefits realized from AI deployments increase gradually over a period of time to realize potential as the software is trained with more data sets to become smarter
- Cost and savings are risk- and present value-adjusted to calculate the ROI
- Initial cost of planning, vendor selection, etc., is estimated separately for contact center, F&A, and insurance-specific operations. To calculate aggregated ROI for Smart RPA for the enterprise, the sum of the initial cost across these business functions is discounted due to rationalization of similar costs at the enterprise level

# ROI from Smart RPA could vary significantly based on specific organizational factors

Overall ROI from Smart RPA could vary significantly – from 50% to 350% – depending on specific organizational characteristics such as process maturity, standardization, delivery mix, and governance

## ROI for a 3-year term

(Percentage of total investment)

### Typical characteristics

- Consolidated FTEs across few delivery locations
- Highly standardized, harmonized, and well documented processes
- Use cases consisting of onshore and offshore/nearshore resource mix
- Highly experienced deployment team / strong Automation CoE support to start with
- High alignment of IT and senior leadership to address any roadblocks / change management
- Short (one to two waves with lift-and-shift approach and limited process changes) or no transition

### Typical characteristics

- Fragmented FTEs across multiple delivery locations
- Low standardization and harmonization with little or no process documentation
- Use cases consisting of nearshore and offshore resource mix
- Relatively newer deployment team / no or low support from Automation CoE at the start
- Low alignment of IT and senior leadership to address roadblocks / change management
- Multi-wave transition (three to five waves) that requires significant process re-engineering

# Summary of business case for Smart RPA in the front office

Smart RPA has the potential to provide steady-state net savings of 9-12%, 3-year risk-adjusted ROI of 40-50% and a payback period of ~13 months

## Impact of Smart RPA on contact center operations in the given scenario

All costs in US\$000s

Year	Year 1	Year 2	Year 3
Number of RDA licenses deployed	1,200-1,300		
Number of RPA licenses deployed	39	16	
Number of chats passed through chatbots <sup>1</sup>	202,071	2,172,267	2,829,000
Initial costs	350		
Deployment costs for RDA and RPA+Chatbots	547	319	0
Hosting – virtual desktop costs	39	54	54
Hosting – central server costs	3	3	3
Monitoring and maintenance costs (RDA+RPA+Chatbots)	46	192	201
License costs for RDA	1,489	1,489	1,489
License costs for RPA	154	216	216
License costs for Chatbots	81	869	1801
Total costs of automation (sum of all software and services costs listed above)	2,708	3,141	3,960
Risk-adjusted PVs of costs	2,634	2,726	3,064
Savings realized from Smart RPA	2,593	5,945	6,627
Risk-adjusted PVs of savings	2,122	4,422	4,481
<b>Risk-adjusted ROI for a 3-year term</b>	<b>= sum of PVs of (savings-costs) divided by sum of PVs of costs</b>		<b>= ~40 to 50%</b>

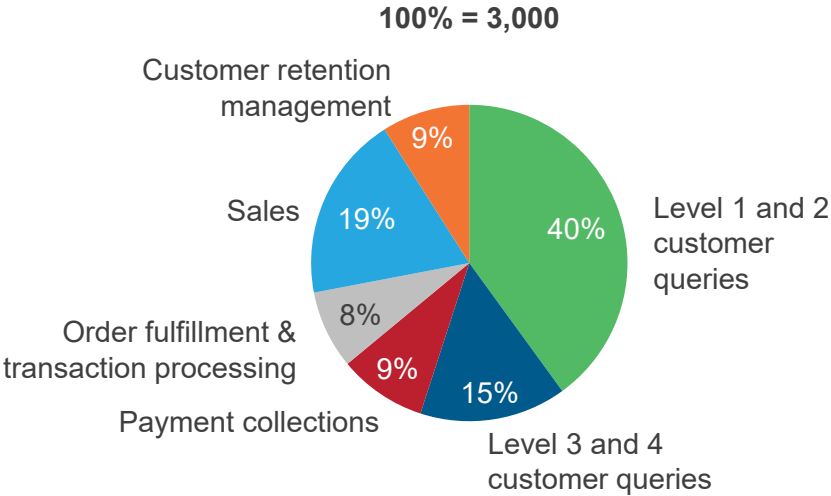

<sup>1</sup> License cost for chatbots is calculated based on the number of chat requests passing through the chatbots  
Source: Everest Group (2018)

# Business case for Smart RPA | Front-office automation

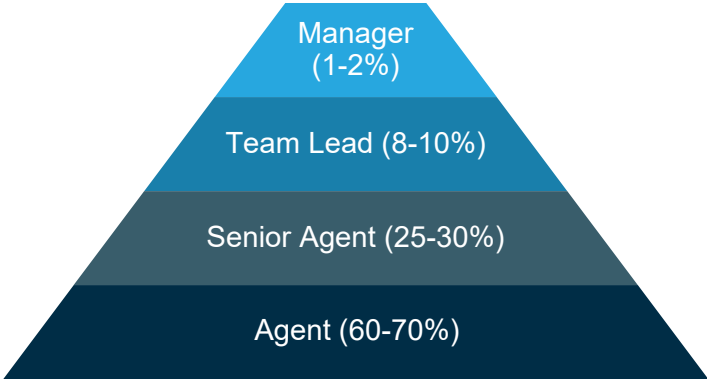

Impact of automation in the front office has been analyzed with a focus on contact center operations

## Business scenario

Split of contact center FTEs by process for a typical enterprise  
Percentage of FTEs

Pre-Smart RPA delivery pyramid  
Percentage of FTEs

## Description of the enterprise's contact center operations

- The enterprise's contact center operations are delivered from both offshore and onshore locations
- A typical contact center function delivery pyramid consists of agents, senior agents, team leads, and managers
- The cost of FTEs varies for onshore and offshore FTEs in each resource category in the delivery pyramid

# Reduction in people cost due to Smart RPA (page 1 of 3)

## FTE headcount reduction could be 8-12% with RPA+chatbots and 15-19% with collective impact of RDA, RPA, and chatbots

Impact of RPA+chatbots on FTEs across processes

The number of RDA licenses is estimated with the following factors/assumptions:

- Contact center agents leveraging RDA generates an average savings of 15%
- Average 8-12% headcount reduction resulting from RPA+chatbots implementation
- Assessment of potential of additional productivity benefits from RDA over macros and other basic automation tools that are typically used across contact center processes

FTE headcount reduction due to RPA and chatbots in contact centers  
Percentage of total contact center FTEs

FTE headcount reduction due to RPA, chatbot, and RDA in contact centers  
Percentage of total contact center FTEs

# Reduction in people cost due to Smart RPA (page 2 of 3)

Blended compensation cost per FTE increases by 6-8% with RPA and chatbots due to movement of FTEs up the delivery pyramid

<sup>1</sup> Includes salaries and mandatory benefits

Source: Everest Group (2018)

# Reduction in people cost due to Smart RPA (page 3 of 3)

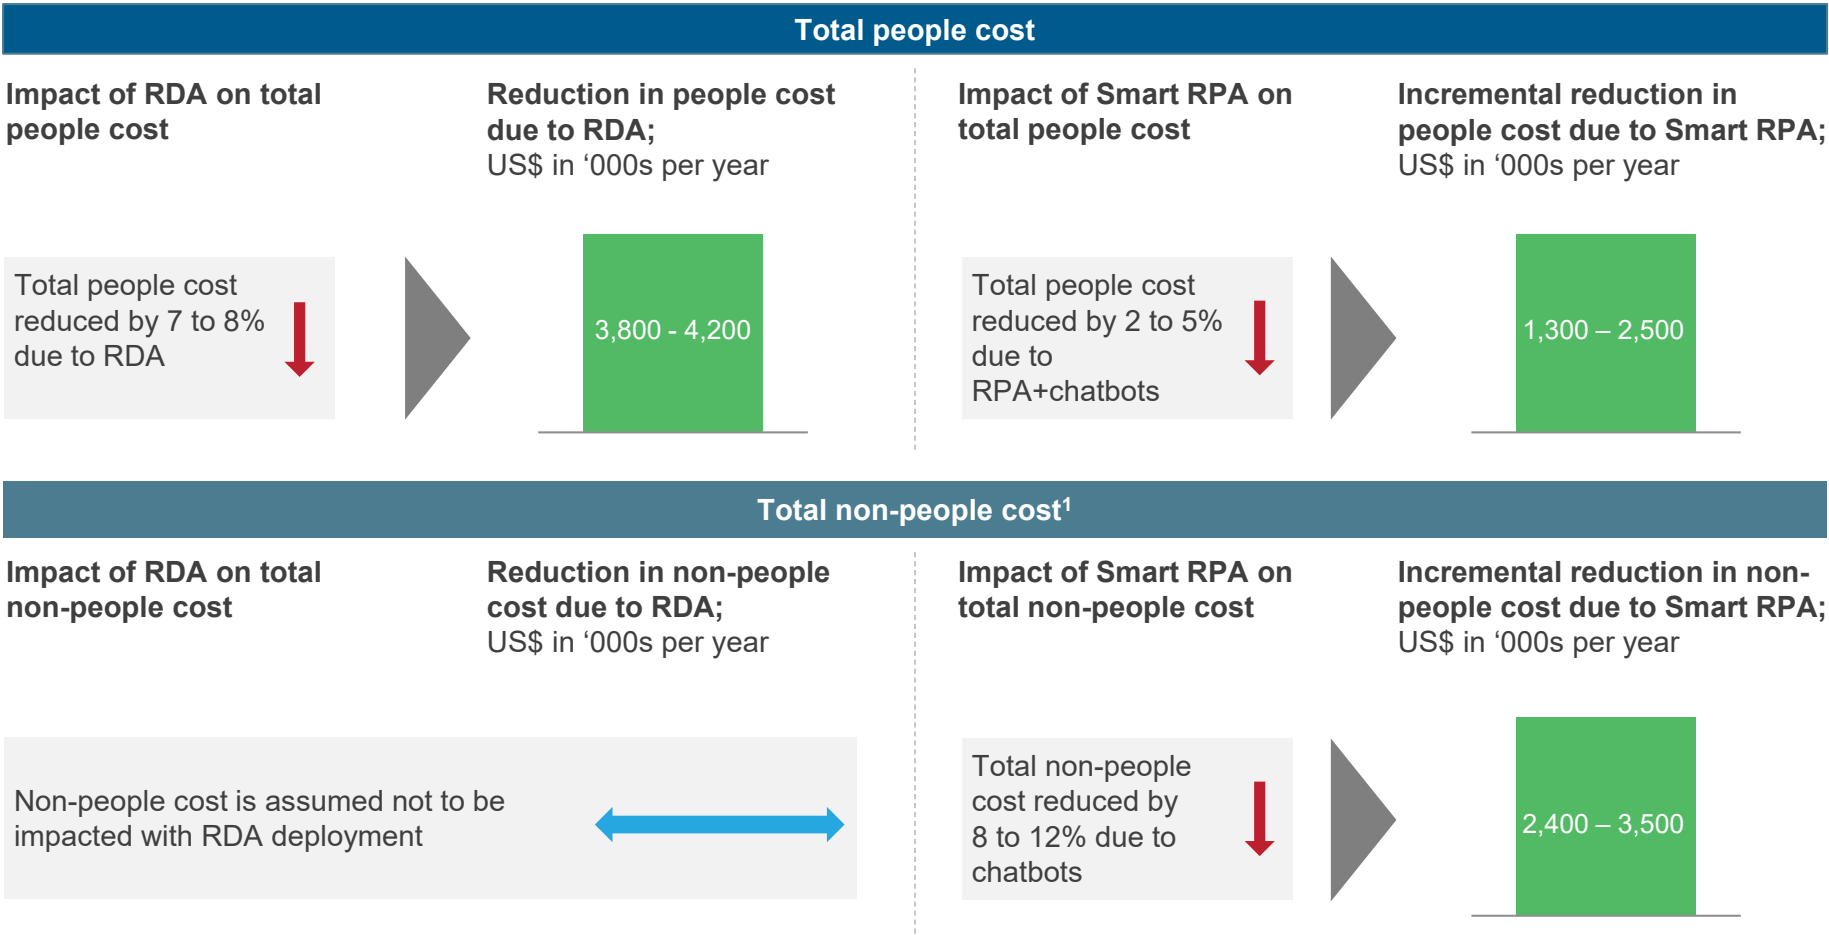

Decrease in FTE headcount and increase in blended compensation cost per FTE impact savings in total people costs with Smart RPA

- In contact center operations, due to the interactive nature of processes, the impact of RPA and chatbots would be similar. While RPA would be leveraged only in non-interactive tasks such as updating customer information in excel sheets, chatbots hold more potential due to their ability to automate basic-level interactive processes. More complex interactive processes such as addressing L3 ad L4 customer queries would still need significant human involvement
- In the unique case of contact center operations, complex and sensitive interactions are usually delivered onshore/nearshore due to language barriers. Thus, chatbots would shift the delivery model slightly toward offshore leverage, thus decreasing blended compensation cost per FTE, unlike RPA, which increases the blended compensation cost per FTE
- The net impact is 7-8% total people cost savings with RDA and 2-5% total people cost savings with RPA+chatbots

# Total cost reduction with Smart RPA

As processes are automated, non-people costs such as facilities and technology decrease by 8-12% with Smart RPA

<sup>1</sup> The reduction in non-people costs typically includes savings that can be achieved in facilities cost, technology cost, and other operation expenses (training & recruitment, administration, and overhead expenses)

# Implementation and running cost of Smart RPA

Costs for RDA, RPA, and chatbots have been accounted for separately where relevant

## Analysis of cost components

All figures in US\$

Cost components	RDA	RPA	Chatbots
Initial cost (planning, vendor selection, POC, initial implementation support, training, CoE enablement, etc.)	0	350,000 spread over the first two quarters; the first is for planning and the second for implementation support (implementation starts from the second quarter)	
Licensing cost (per year)	1,200 per license	4,000 per license	0.4 per chat request
Hosting – virtual desktop cost (per year)	0	1,000 per license	Included in license cost
Hosting – central server cost (per year)	0	3,000	Included in license cost
Monitoring and maintenance cost (per year)	0	1,500 per license (starting from the quarter after the one in which the RPA batch is deployed)	120,000 per year after the chatbot deployment reaches steady state (i.e., 14%)
Deployment cost (use case identification, development, environment set-up, testing, deployment, etc.)	200,000; distributed equally over RDA implementation period (i.e., two quarters)	4,000 one-time cost per robot	450,000 (total cost of chatbot implementation and maintenance until steady state)

Licenses required	RDA	RPA	Chatbots
Number of licenses	1,200-1,300 (calculated by FTEs requiring RDA licenses across all processes)	44-64 (assuming one RPA license automates two FTEs worth of work)	Licensing cost is based on the number of chats processed

# Payback period analysis for Smart RPA in contact center operations

- For this analysis, the benefits from RDA deployment in every quarter are assumed to be realized fully within the same quarter
- The organization has about 7% chat requests (out of the total requests across different channels). Due to chatbot deployment, the share of chat requests is assumed to increase to about 14% as a result of channel deflection over a period of about 12 months following chatbot implementation
- Chatbot is implemented and scaled up over a period of about seven quarters until it reaches steady state. In steady state, 14% of all contact center customer transactions/communications are assumed to be chat-based. Benefits realized through chatbots depend on the number of chats passed through chatbots and the percentage of those chats that are straight-through processed by chatbots without human intervention. The number of chats passing through chatbots scales up every quarter from 4% to 14% of total requests in the contact center across all channels

# Summary of business case for Smart RPA in F&A

Smart RPA has the potential to deliver steady-state net savings of 25-40%, 3-year risk-adjusted ROI of ~250%, and a payback period of ~12 months in F&A operations

## Impact of Smart RPA on F&A operations in the given scenario

All costs in US\$000s

Year	Year 1	Year 2	Year 3
Number of RPA licenses deployed <sup>1</sup>	70	94	23
Number of IDP licenses deployed <sup>1</sup>	8	10	3
Initial costs	300		
Deployment costs for RPA	282	376	94
Deployment costs for IDP	70	94	23
Hosting – virtual desktop costs (RPA)	70	164	188
Hosting – central server costs (RPA and IDP)	10	10	10
Monitoring and maintenance costs (RPA)	26	158	273
Monitoring and maintenance costs (IDP)	6	35	61
License costs for RPA	282	657	751
License costs for IDP	78	183	209
Total costs of automation (sum of all software and services costs listed above)	1,125	1,677	1,608
Risk-adjusted PVs for costs	1,094	1,455	1,244
Savings realized from Smart RPA	1,131	5,996	10,173
Risk-adjusted PVs of savings	925	4,459	6,879
<b>Risk-adjusted ROI for a 3-year term</b>	<b>= sum of PVs of (savings-costs) divided by sum of PVs of costs</b>		<b>= ~220 to 270%</b>

<sup>1</sup> Deployment for both RPA and IDP starts from the second quarter and is spread equally over eight quarters

# Business case for Smart RPA | Back-office automation

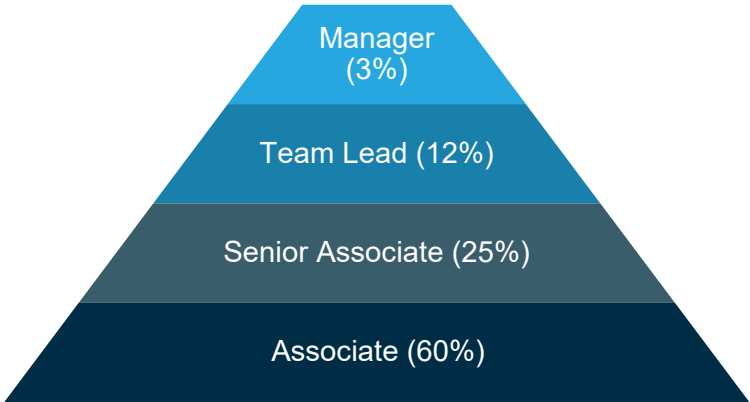

## The impact of back-office automation been analyzed for F&A operations

### Business scenario

Split of F&A FTEs by process for a typical enterprise  
Percentage of FTEs

Pre-Smart RPA delivery pyramid  
Percentage of FTEs

### Description of the enterprise's F&A operations

- The enterprise's F&A operations are delivered from both offshore and onshore locations
- A typical employee delivery pyramid for the F&A function consists of associates, senior associates, team leads, and managers. The onshore-offshore employee mix at each level of the delivery pyramid varies by enterprise
- The FTE costs vary for onshore and offshore FTEs within each resource category in the delivery pyramid

# Reduction in people cost due to Smart RPA in F&A (page 1 of 3)

FTE headcount reduction could be 31-44% with RPA and 12-21% with IDP

Impact of RPA and Intelligent Document Processing (IDP) on FTEs across processes

RPA IDP

FTE headcount reduction due to RPA in F&A operations  
Percentage of total FTEs

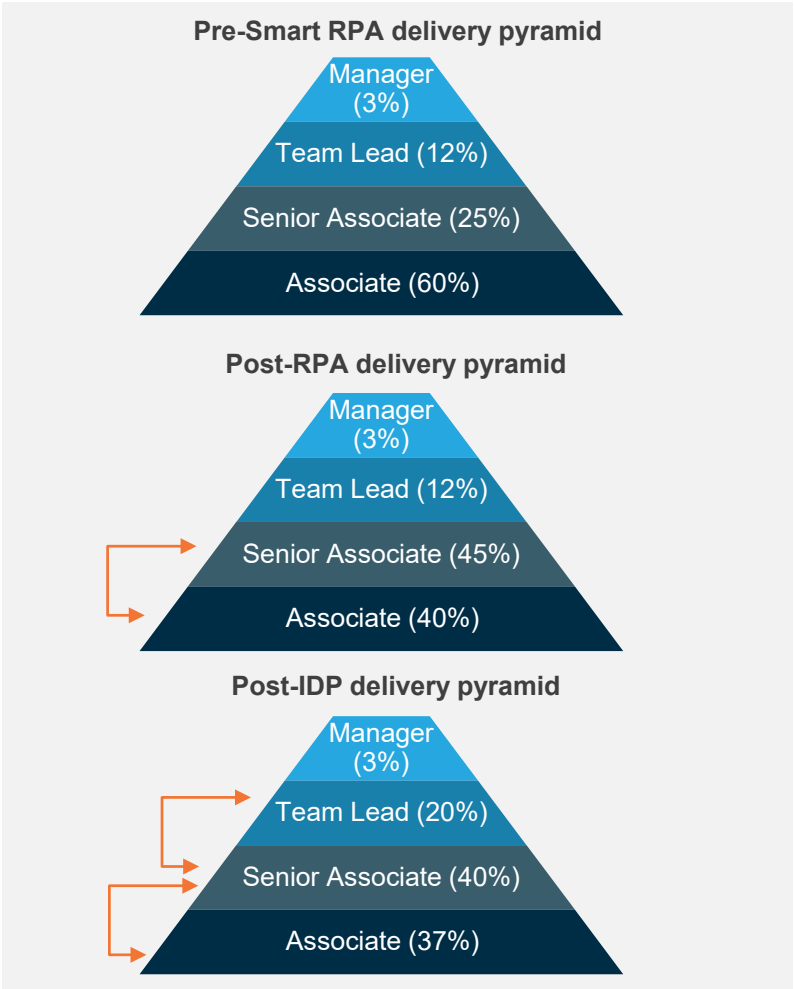

FTE headcount reduction due to IDP in F&A operations  
Percentage of total contact center FTEs

# Reduction in people cost due to Smart RPA in F&A (page 2 of 3)

Due to movement of FTEs towards top of the delivery pyramid, blended compensation cost per FTE could increase by ~6% with RPA and ~9% with IDP

Compensation cost per FTE<sup>1</sup>;  
2018; US\$ in '000s per FTE per year

Blended compensation cost per FTE;  
2018; US\$ in '000s per FTE per year

Compensation cost per FTE has been calculated considering optimum distribution of FTEs at each level in the delivery pyramid across onshore and offshore locations

As associates and senior associates start to gather skills for more business-specific, judgment-intensive tasks, the delivery pyramid narrows at the bottom

<sup>1</sup> Includes salaries and mandatory benefits  
Source: Everest Group (2018)

Decrease in FTE headcount and increase in blended compensation cost per FTE together impact savings in total people costs with Smart RPA

# Total cost reduction with Smart RPA in F&A

As processes are automated, non-people costs such as facilities and technology costs decrease by 33-38% with RPA and 9-17% with IDP

<sup>1</sup> The reduction in non-people costs typically includes savings in facilities, technology, and other operations (training and recruitment, administration, and overhead expenses) costs  
Source: Everest Group (2018)

# Implementation and running cost of Smart RPA in F&A

Implementation costs computation assumes deployment of an equal number of robots every quarter, spread across two years

## Analysis of various cost components

All figures in US\$

Cost components	RPA	IDP
Initial cost (planning, vendor selection, POC, initial implementation support, training, CoE enablement, etc.)	300,000 incurred over the first two quarters of the Smart RPA project; the cost in the first quarter is for planning and in the second quarter is for implementation support (implementation starts from the second quarter)	
Licensing cost (per year)	4,000 per license	10,000 per license
Hosting – virtual desktop cost (per year)	1,000 per license	-
Hosting – central server cost	10,000 per year	
Monitoring and maintenance cost (per year)	1,500 per license starting from the quarter after the one in which the RPA batch is deployed	3,000 per license starting from the quarter after IDP is deployed
Deployment cost (use case identification, development, environment set-up, testing, deployment, etc.)	4,000 per robot	9,000 per robot

Licenses required	RPA	IDP
Number of licenses	157-218 (assuming one RPA license automates two FTEs' work)	21-25 (assuming one IDP license automates four FTEs' work)

# Payback period analysis for Smart RPA in F&A

Time-to-value realization

- The payback period depends on two major factors
  - Speed of robot deployment and achievable scalability
  - Transition period to achieve the full potential of automation
- The benefit realization for IDP is spread across a longer time period than for RPA because an IDP robot has a learning period before it can deliver substantial savings
- For this analysis, the benefit realization for the RPA batch deployed in every quarter is assumed to be 25% in the same quarter and 100% in the following quarter; for IDP deployment, it is assumed to increase from 20% in the following quarter to 100% over a period of five quarters

# Smart RPA enables digital transformation of front- and back-office operations

 Learning process

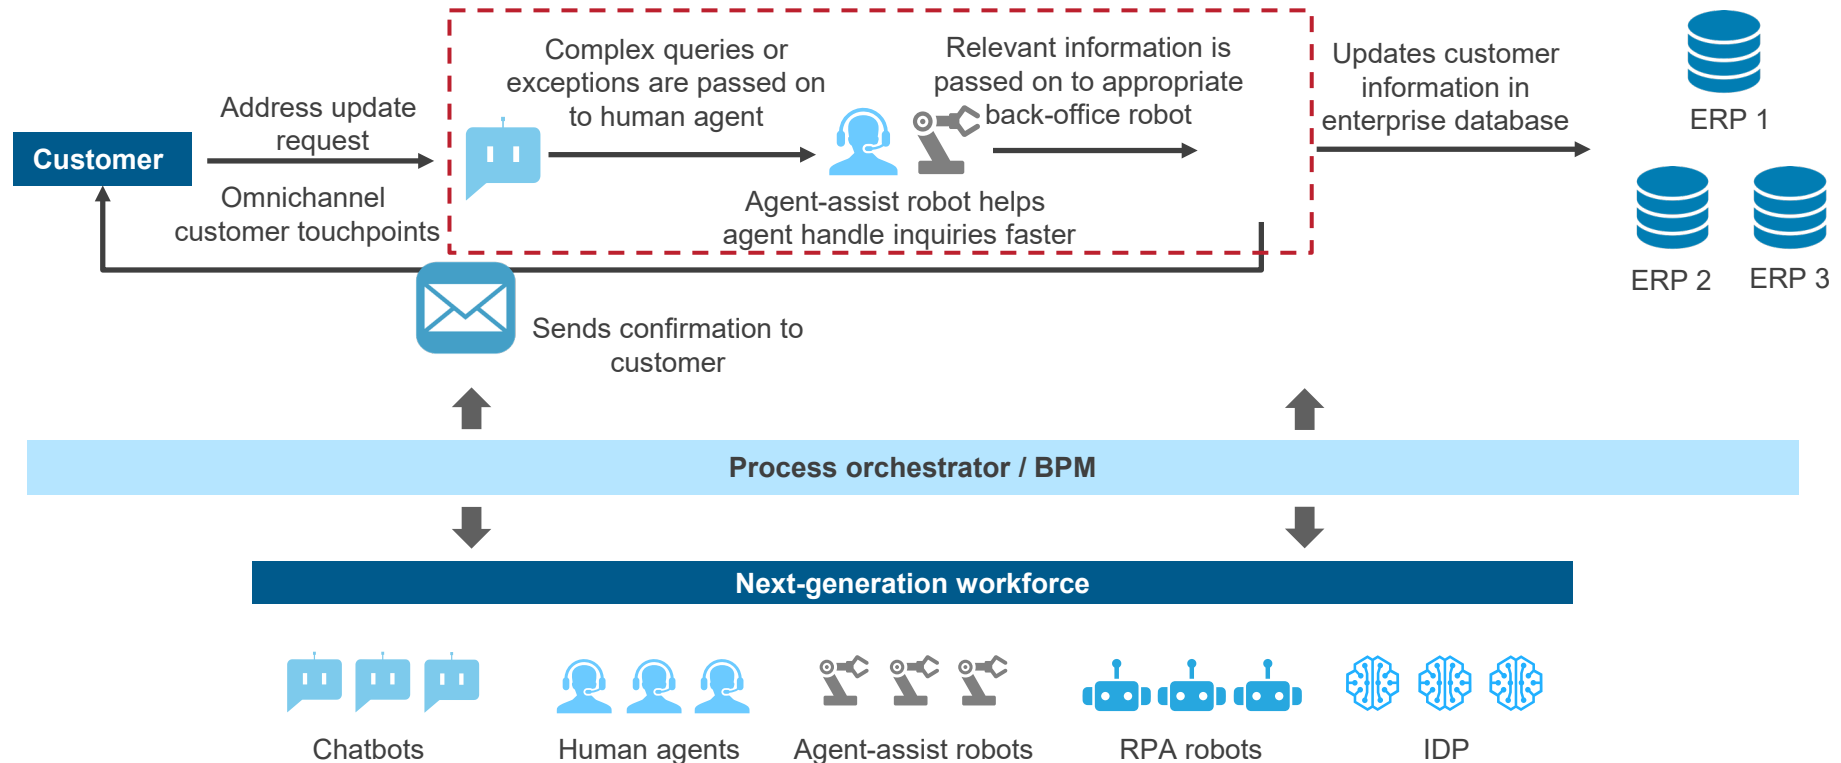

# Chatbots address low and medium-complexity customer queries and are integrated with RPA robots to extract/enter relevant information based on customer inquiries

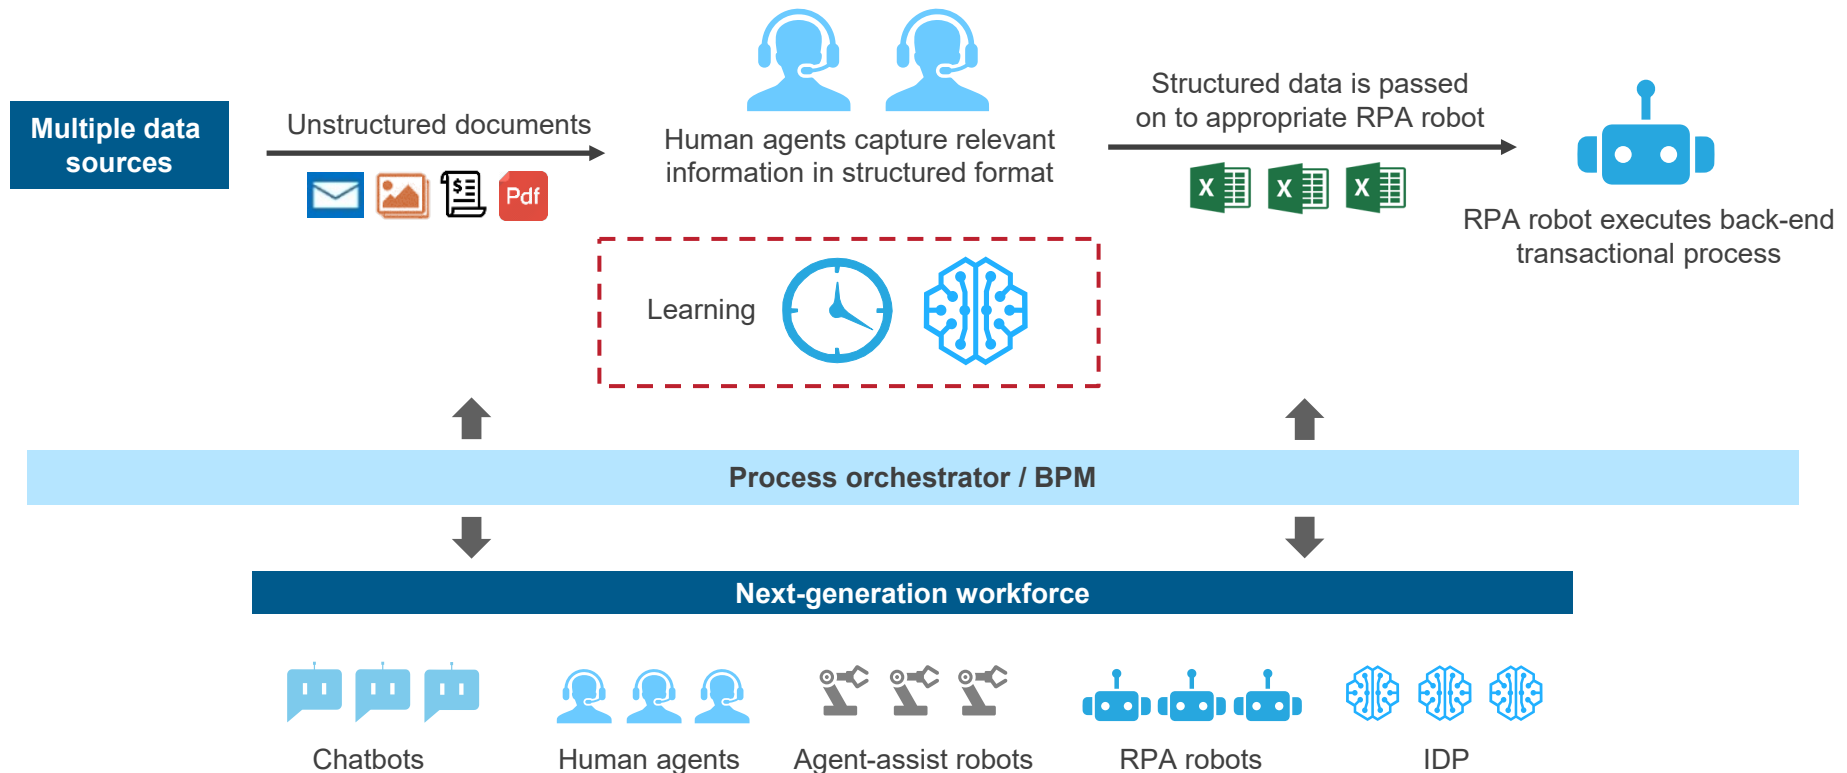

Process orchestrator / BPM capability integrated within a Smart RPA platform governs the process flow and routes work to the best worker (human or robot) based on the nature, type, and criticality of the task for optimal delegation, process continuity, and end-to-end analytics.

# Complex queries and exceptions are routed to human agents; agent-assist robots help them to solve queries quickly and accurately

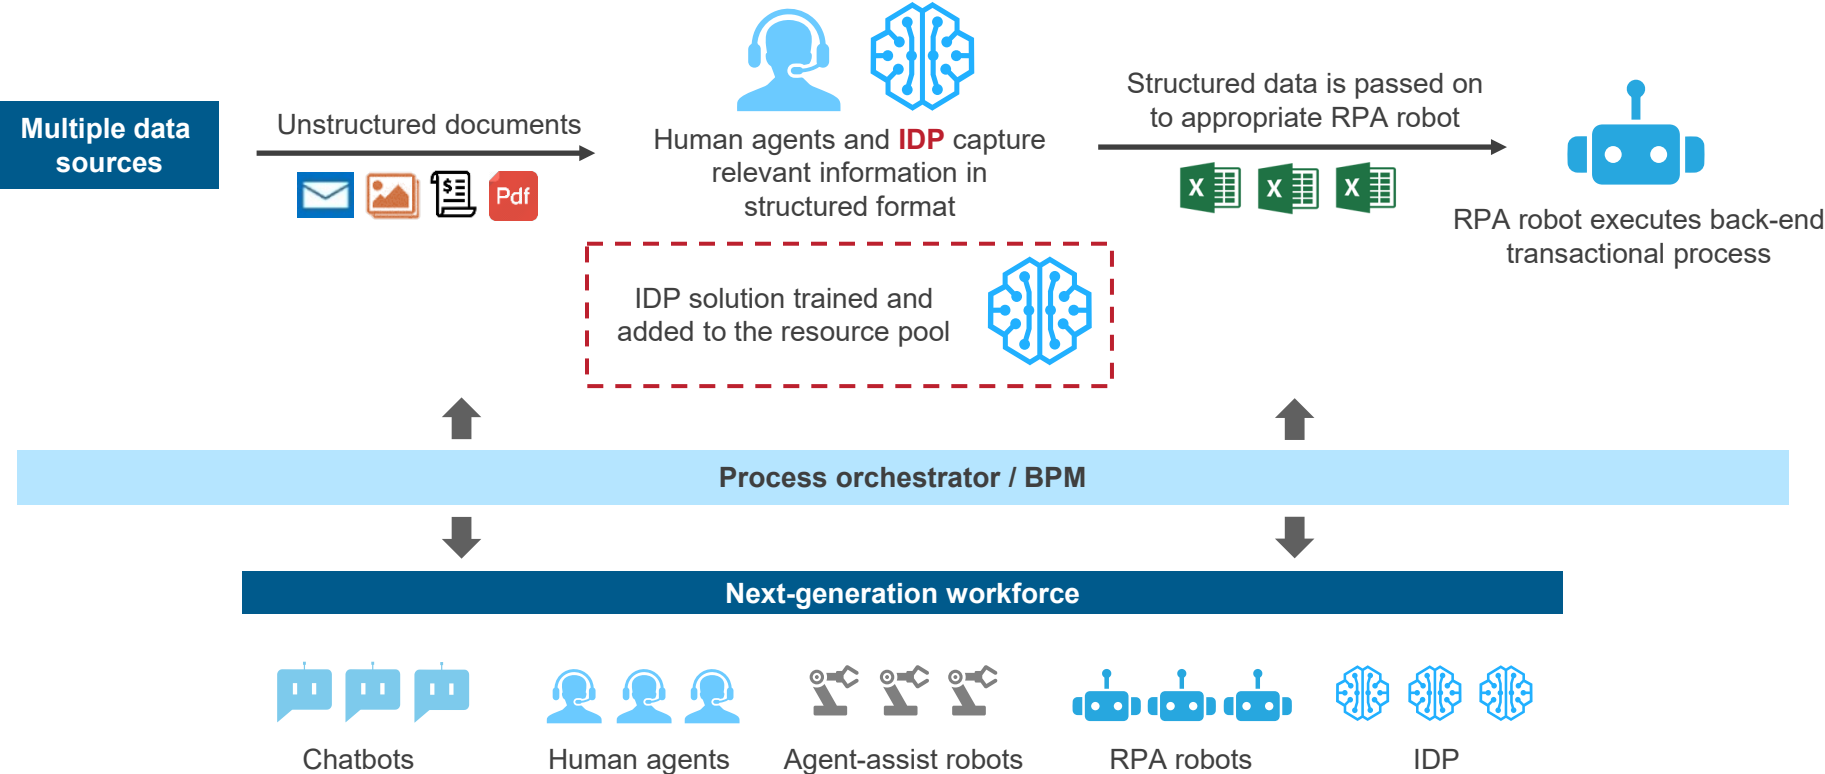

Process orchestrator / BPM capability integrated within a Smart RPA platform governs the process flow and routes work to the best worker (human or robot) based on the nature, type, and criticality of the task for optimal delegation, process continuity, and end-to-end analytics.

# Unstructured documents are processed by human agents and IDP solution is trained by observing human actions

Process orchestrator / BPM capability integrated within a Smart RPA platform governs the process flow and routes work to the best worker (human or robot) based on the nature, type, and criticality of the task for optimal delegation, process continuity, and end-to-end analytics.

# Once training is complete, the workload is distributed between agents and IDP solution, based on the predicted accuracy rates or confidence level of robots

When confidence level of robots is low – as is with exceptions – the task is routed to the exception management team. IDP provides capability to observe how humans handle these exceptions and improve their accuracy accordingly. If the confidence level rises above a given threshold, and there are no exceptions, the process is completed and structured data is created.

  - Appendix A: Digital workforce and the office of the future
  - **Appendix B: Enterprises' environmental determinants**
  - Appendix C: Variations in execution steps
  - Appendix D: Establishing a Smart RPA CoE
  - Appendix E: Glossary of key terms

# Environmental determinants

## 1. Organization structure

Highly centralized, with little independent decision-making

Partially centralized with portions of decision-making federated to BUs

Largely federated decision-making – BUs have large degree of freedom to make their own decisions

## 2. People centricity

Highly people-centric organization – overall culture is people-driven rather than efficiency-driven

Middle-ground organization with focus on people as assets with efficiency also playing a role

Efficiency- and/or technology-driven organization

## 3. Sensitivity to change

Very sensitive to change – even the slightest change can disrupt the organizational workforce

Willing to accept smaller incremental changes but not large systemic changes

Progressive mindset to change – workforce is receptive and accepting of even transformative change

# Environmental determinants

## 4. Technology savviness

Highly technology savvy – IT organization plays the role of innovation leader

Moderate level of technology savviness – IT supports most initiatives and spearheads a few

Low level of technology savviness – IT plays a supporting role in innovation

## 5. Initiating stakeholder(s)

Operations-driven initiatives – driven by operations analysts trying to make their jobs easier

BU-driven initiative with IT support

Centrally-driven, typically by the C-suite or one level below with all BUs and IT falling in line

## 6. Risk appetite

Low risk appetite – need to have multiple layers of checks and balances for any initiative

Medium risk appetite – willing to take risks in select scenarios, especially when dictated by the market

High risk appetite – willing to take risks in the hope of market leadership and payoff

# Environmental determinants

## 7. Level of control over operations

## 8. Existing partnerships

2	Plan implementation timelines, governance, and skill development for automation and reskilling for affected employees	NA	NA
3a	Obtain alignment with IT for specific initiative	<ul style="list-style-type: none"> <li>• Organization structure</li> <li>• Technology savviness</li> <li>• Initiating stakeholder(s)</li> </ul>	<ul style="list-style-type: none"> <li>• IT minimally involved</li> <li>• IT co-creates</li> <li>• IT takes the lead</li> </ul>
3b	Obtain team buy-in, particularly impacted FTEs	<ul style="list-style-type: none"> <li>• Sensitivity to change</li> <li>• People centricity</li> </ul>	<ul style="list-style-type: none"> <li>• Open communication with team – affected members and those unaffected</li> <li>• Selective communication to impacted employees</li> <li>• Minimal communication</li> </ul>
4	Select appropriate vendor tool based on capabilities and automation need	<ul style="list-style-type: none"> <li>• Existing partnerships</li> <li>• Risk appetite</li> </ul>	<ul style="list-style-type: none"> <li>• Leverage existing relationships</li> <li>• Evaluate other vendors while leveraging existing relationships</li> <li>• Evaluate the entire vendor landscape with fresh eyes</li> </ul>

# Variance in execution path steps for organizations by environmental determinants (2/5)

## Phase 2

#	Steps	Determinants	Path options
5	Obtain management buy-in and budget	<ul style="list-style-type: none"> <li>Organization structure</li> <li>Initiating stakeholder(s)</li> </ul>	<ul style="list-style-type: none"> <li>Buy-in and budget at team-lead level</li> <li>Buy-in and budget at BU level</li> <li>Buy-in and budget central</li> </ul>
6a	Initiate continuous communication as part of change management	<ul style="list-style-type: none"> <li>Sensitivity to change</li> <li>People centrality</li> </ul>	<ul style="list-style-type: none"> <li>Low to no communication</li> <li>Medium frequency of communication</li> <li>Frequent communication</li> </ul>
6b	Initiate development of talent for automation development and maintenance	<ul style="list-style-type: none"> <li>Control over operations</li> <li>Technology savviness</li> </ul>	<ul style="list-style-type: none"> <li>Develop talent in-house</li> <li>Use a combination of in-house and vendor/consulting talent</li> <li>Use mostly external talent and/or outsource/partner</li> </ul>
6c	Initiate governance mechanism	<ul style="list-style-type: none"> <li>Risk appetite</li> <li>Control over operations</li> </ul>	<ul style="list-style-type: none"> <li>Minimal, ad hoc governance</li> <li>Standard set of tracking for metrics</li> <li>Comprehensive governance, including dashboards for measuring performance, speed and accuracy</li> </ul>
6d	Initiate reskilling for affected employees	<ul style="list-style-type: none"> <li>People centrality</li> </ul>	<ul style="list-style-type: none"> <li>No reskilling/upskilling – impacted FTEs may be downsized or reassigned</li> <li>Upskilling only for high-performing employees, rest reassigned/downsized</li> <li>Reskilling/upskilling of all employees (all retained)</li> </ul>

# Variance in execution path steps for organizations by environmental determinants (3/5)

## Phase 2

#	Steps	Determinants	Path options
7	Develop pilot for the prioritized process	NA	NA
8	Cut to production with human supervision until automation achieves desired efficiency	<ul style="list-style-type: none"><li>• Risk appetite</li></ul>	<ul style="list-style-type: none"><li>• Always employ a human in the loop</li><li>• Employ a human in the loop for verification for highly sensitive processes only</li><li>• Allow STP where possible, with only exceptions requiring human intervention</li></ul>
9	Continuously monitor and report on metrics/KPIs	NA	NA
10	Repeat journey with next process in the priority list	NA	NA

# Variance in execution path steps for organizations by environmental determinants (4/5)

## Phase 3

#	Steps	Determinants	Path options
11	Build up CoE structure	<ul style="list-style-type: none"> <li>Organization structure</li> </ul>	<ul style="list-style-type: none"> <li>Centralized operations</li> <li>Hub and spoke model</li> <li>Decentralized CoE operations</li> </ul>
12	Evaluate balance of automation skill sets	<ul style="list-style-type: none"> <li>Control over operations</li> <li>Technology savviness</li> </ul>	<ul style="list-style-type: none"> <li>Develop talent in-house</li> <li>Use a combination of in-house and vendor/consulting talent</li> <li>Use mostly external talent and/or outsource/partner</li> </ul>
13	Set up a team to evaluate opportunities	<ul style="list-style-type: none"> <li>Organization structure</li> </ul>	<ul style="list-style-type: none"> <li>Centrally nominated and controlled</li> <li>Centrally controlled with nominations from business units</li> <li>Truly cross functional, nominally centralized</li> </ul>
14a	Scale up and run operations	NA	NA
14b	Continuously monitor and report on metrics/KPIs	NA	NA

# Variance in execution path steps for organizations by environmental determinants (5/5)

## Phase 4

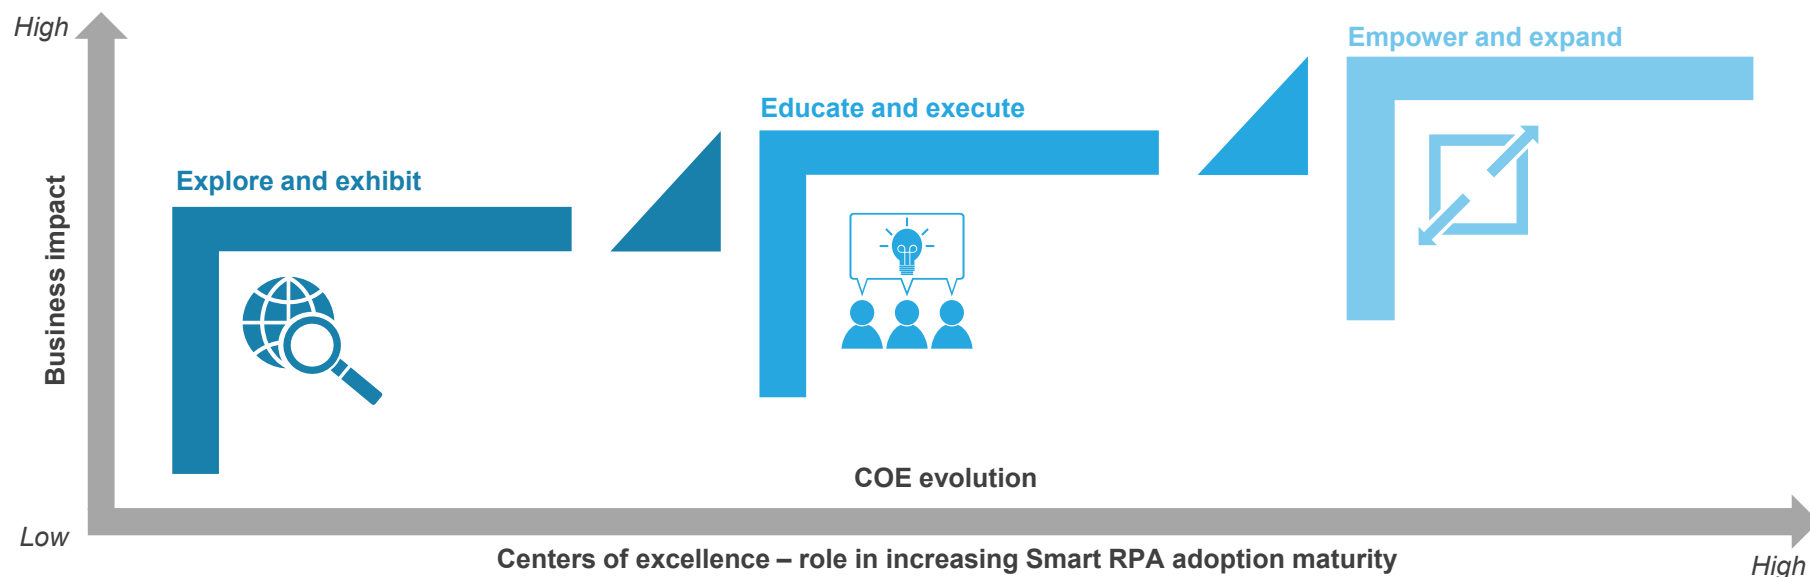

#	Steps	Determinants	Path options
15a	Put a strategic model in place (for example chargeback mechanisms and RPA CoE)	NA	NA
15b	Templatize opportunity evaluation and processing	NA	NA
15c	Create development standards and reusable code libraries	NA	NA
16	Enable various exposure mechanisms – road shows, hackathons, project of the year, and newsletters to create awareness	NA	NA
17	Scale up further	NA	NA
18	Continuously monitor and report on metrics/KPIs	NA	NA

- Introduction to Smart RPA
- Enterprise Smart RPA journey
- Accelerating the Smart RPA journey
- Enterprise case studies
- Pinnacle Enterprises™ Smart RPA maturity model
- Developing the business case for Smart RPA
- Appendix
  - Appendix A: Digital workforce and the office of the future
  - Appendix B: Enterprises' environmental determinants
  - Appendix C: Variations in execution steps
  - **Appendix D: Establishing a Smart RPA CoE**
  - Appendix E: Glossary of key terms

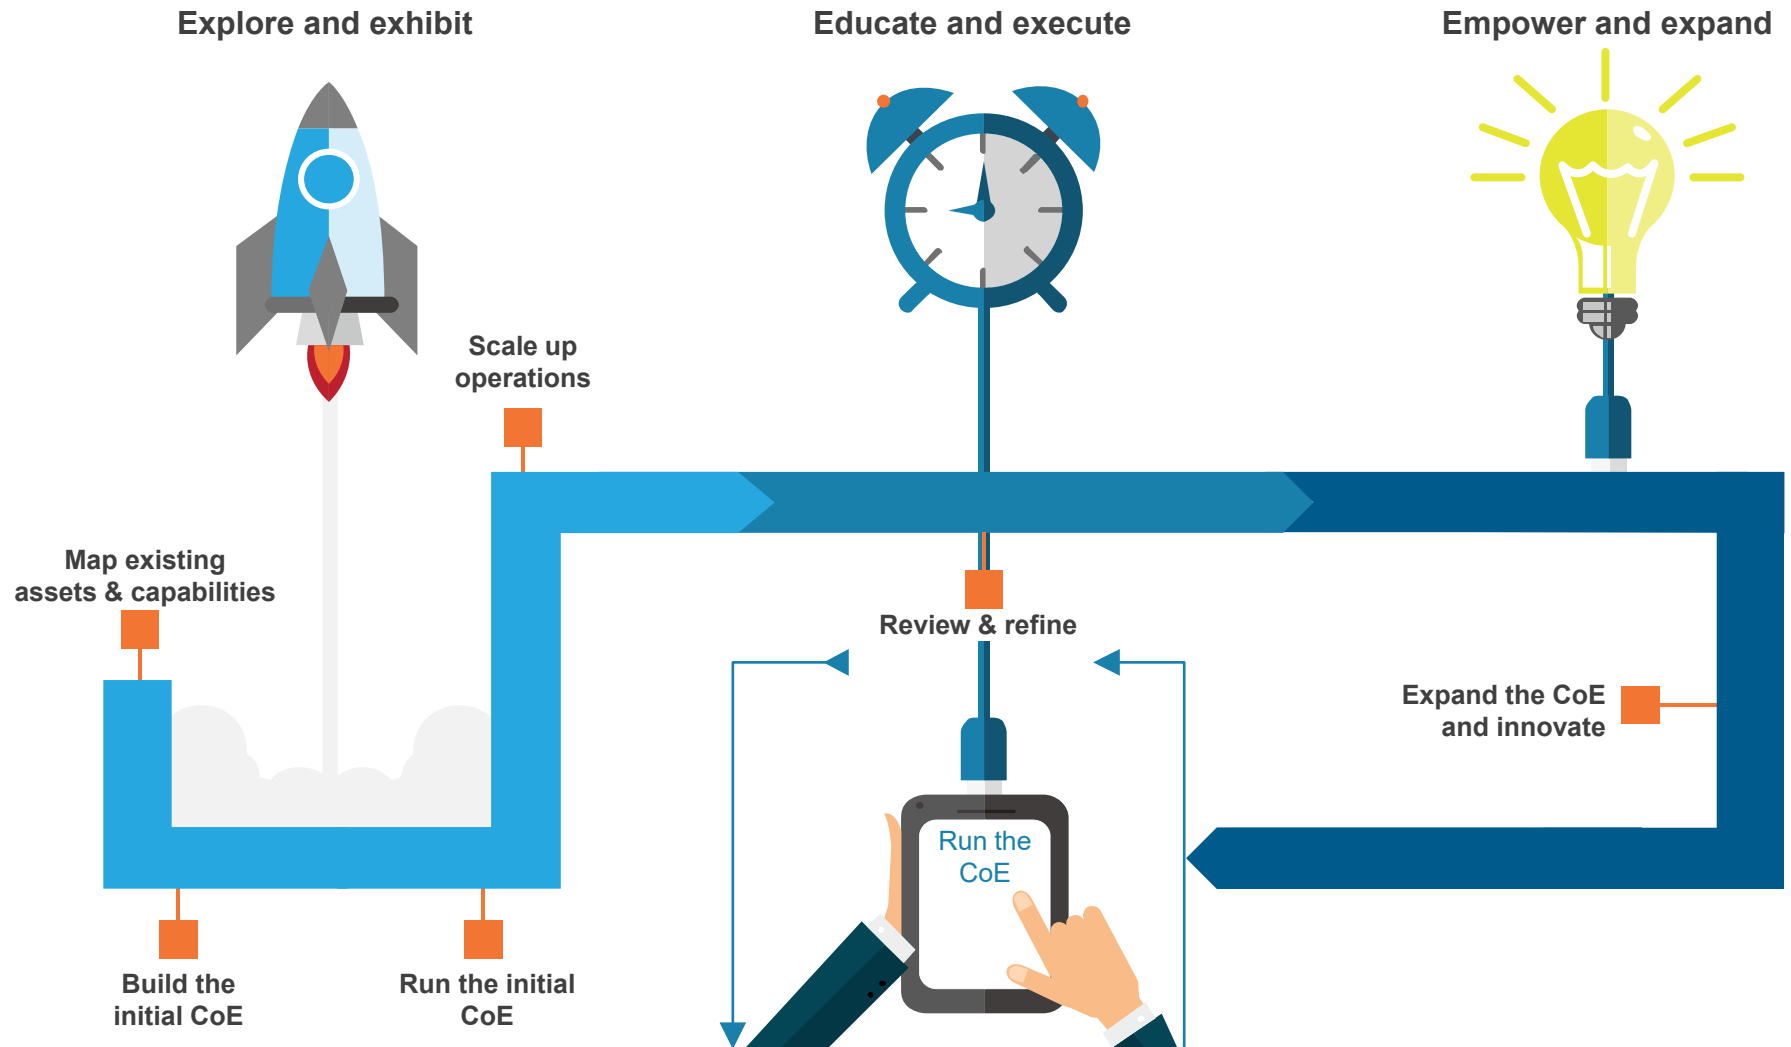

# The CoE evolves to support enterprises at various phases of their Smart RPA journeys

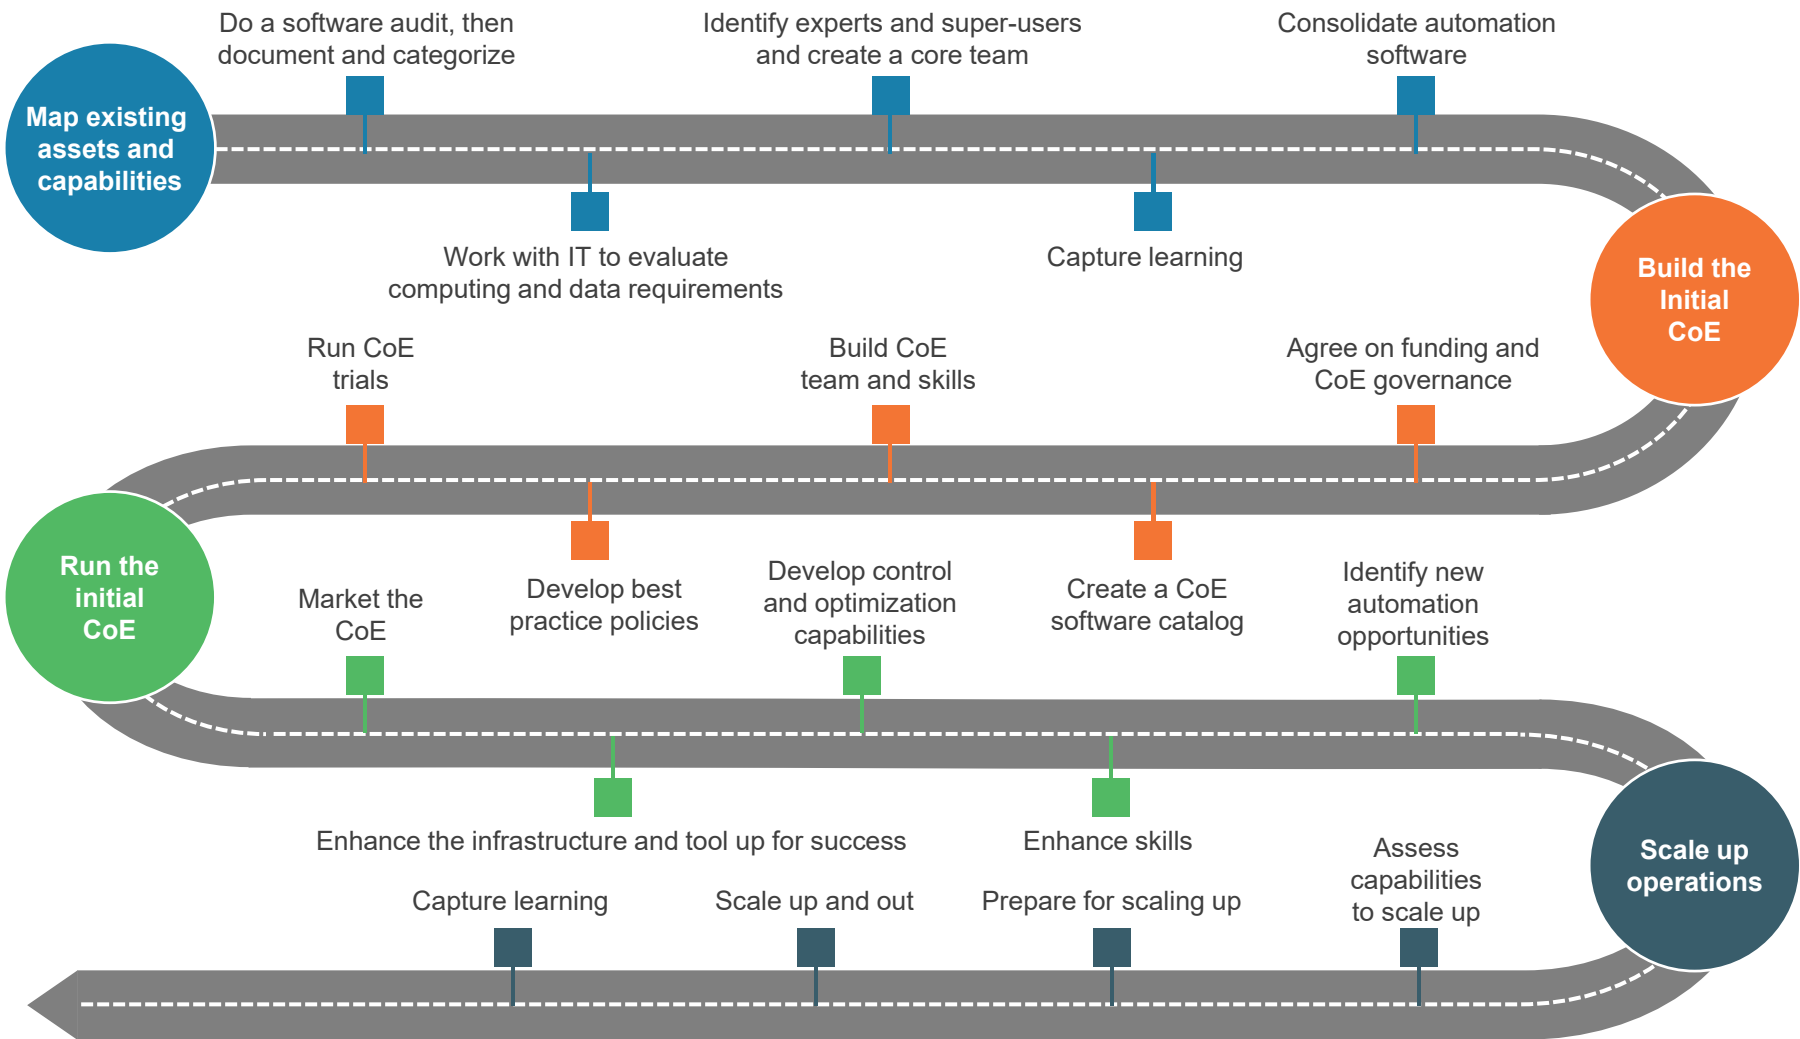

## Focus areas

- Form leadership team, and outline roles, responsibilities, and structures for collaboration with IT and other corporate functions
- Evaluate IT and data management requirements for Smart RPA
- Augment skills and technology with third-party vendor support
- Develop POC, secure buy in, pilot, and implement solutions
- Create awareness – showcase the benefits to the larger enterprise
- Develop computing power, infrastructure, and data management capabilities to enable Smart RPA
- Develop in-house Smart RPA experts and optimize vendor leverage
- Educate business owners on Smart RPA implementation
- Assist businesses in executing Smart RPA solutions
- Institutionalize governance mechanisms
- Develop structured frameworks that enable business units to execute Smart RPA on their own with centralized governance and support from the CoE and IT
- Expand Smart RPA initiatives across different locations, and scale up solutions
- Continuously identifying new opportunities for automation and innovation

# Building and expanding an automation CoE is a closed loop process

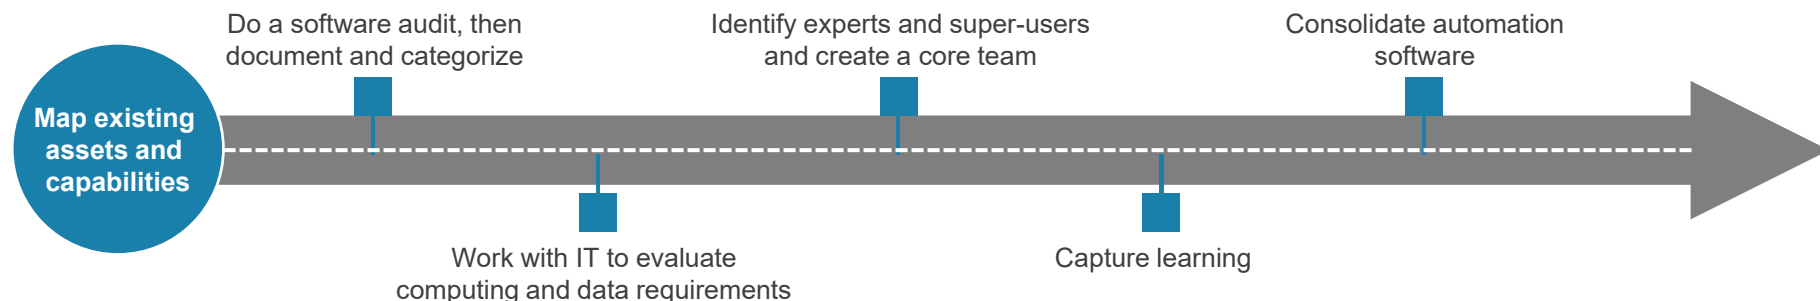

# Starting up an automation CoE: A roadmap

# Map existing automation assets and capabilities

Taking stock of existing computing and automation capabilities accelerates the set-up phase of the CoE

## Rationale behind these steps

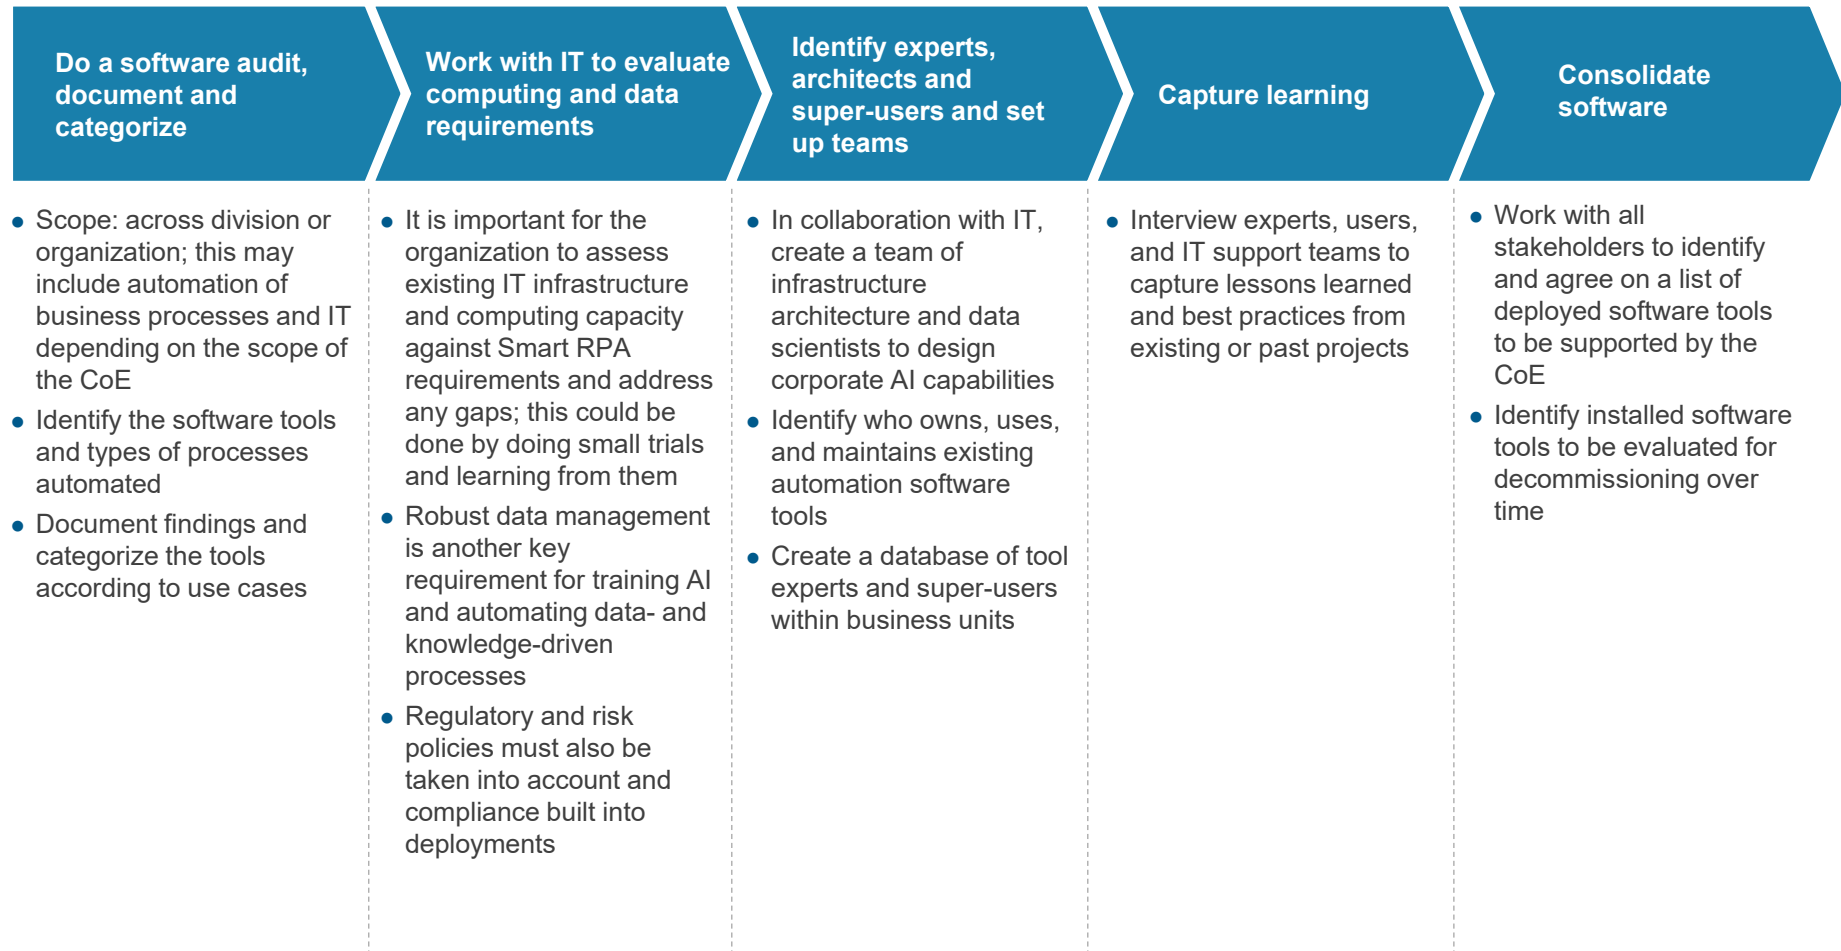

- It is likely that the organization has developed and deployed multiple automation tools and even dabbled with AI, but these efforts could be unknown to IT. These projects must be identified and consolidated to create a manageable catalog of solutions that the CoE will utilize and support
- Smart RPA will have AI components that require extra computing power and infrastructure and robust data management. An architecture team has to assess and address these requirements. Options for deployment on the cloud should always be considered within the organization's IT, security, and risk policies. Organizations should not be put off by these requirements. Many start with pure RPA before moving on to Smart RPA and, in the process, learn a lot about automation computing requirements and optimization of run time environments. Capabilities for AI will take them further into computing capacity and infrastructure extensions and optimization
- It is also important to take advantage of existing expertise and nurture and grow it to accelerate the CoE set up and development
- If there are existing automation capabilities and competencies, the organization should evaluate the pros and cons of using them, including any organizational dependencies and risks, instead of investing in new solutions
- It is important to consolidate the automation software and decommission those that are least useful so they do not become a cost and maintenance burden to the CoE and IT

# Map existing automation assets and capabilities

Create the computing infrastructure for Smart RPA and consolidate existing solutions to optimize automation capabilities

## Typical activities within each step

# Building an initial CoE for a POC enables organizations to gain experience without over-committing to the concept

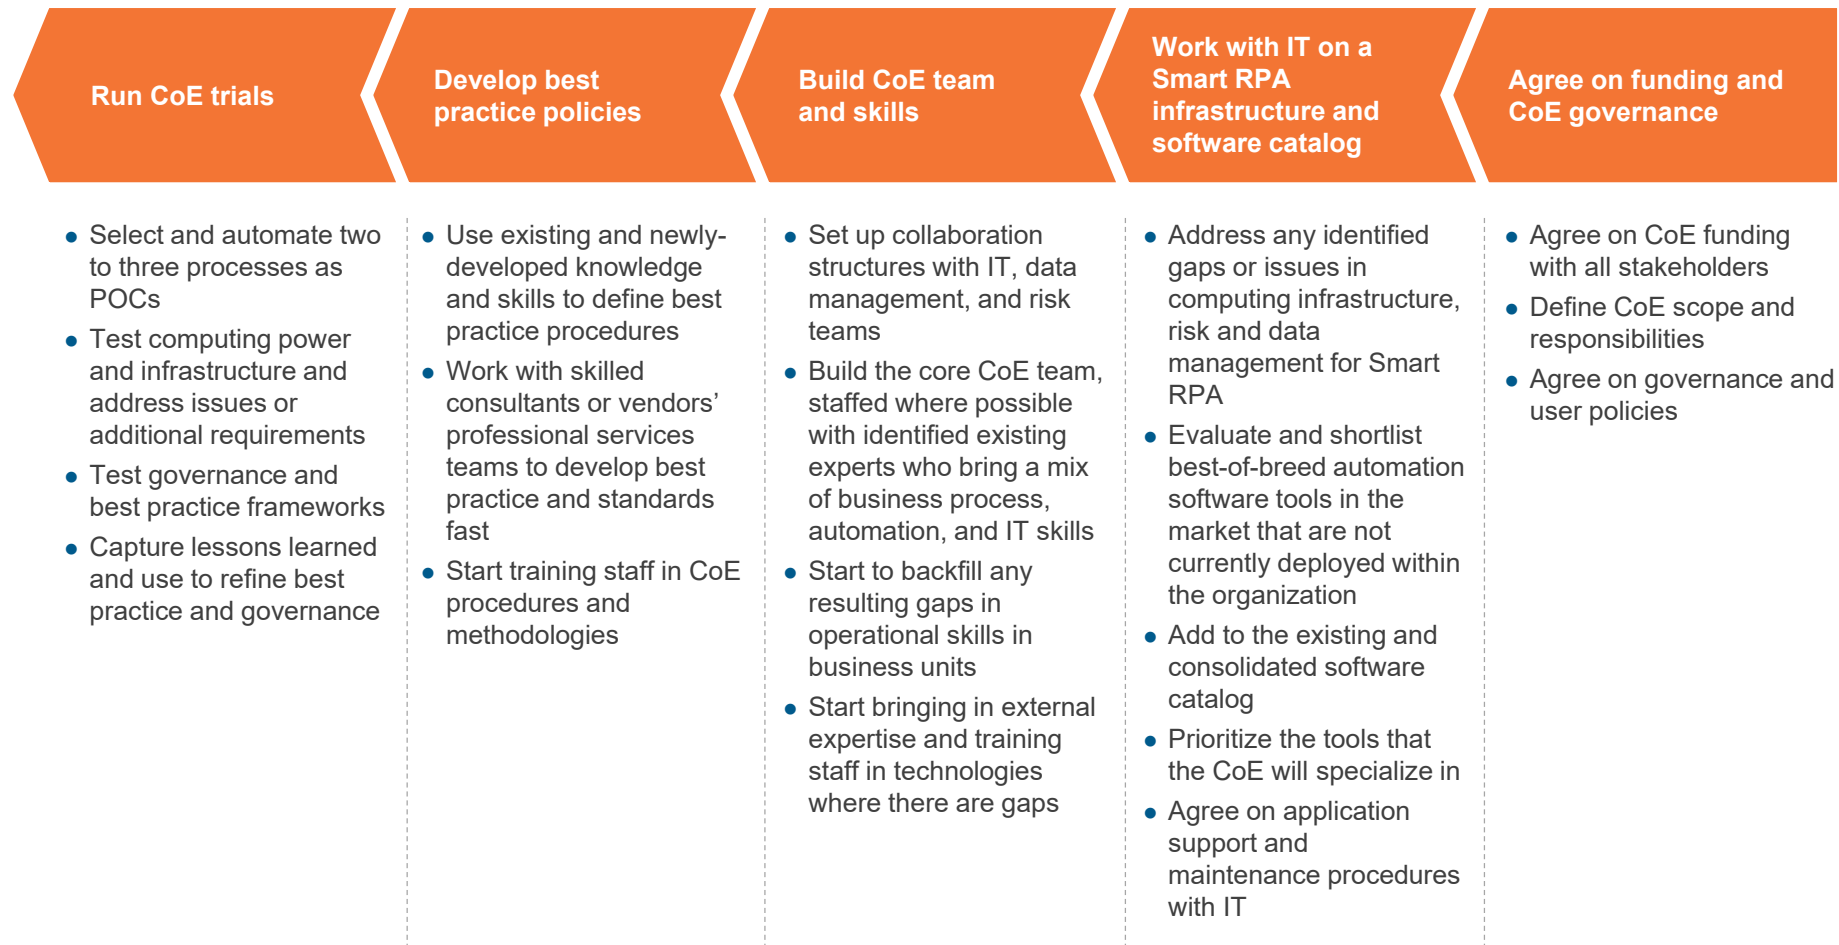

- It is important for the CoE to set up collaboration structures to work with IT, corporate compliance and risk management, and the data management function, or create such a functions if they do not exist
- The CoE requires funding. Common funding models include:
  - Option 1: Technology costs are divided equally among all departments; projects are charged separately
  - Option 2: User departments pay for automation licenses and IT; CoE staffing and project costs come from central funding
- Existing automation projects and skills offer a head start in creating the knowledge base for a CoE
  - Capture lessons learned and best practices from existing projects as the basis of a new formal best practice framework and policies for the CoE. These lessons should include AI-enablement and deployment, how to select processes for automation, requirements capture, business case evaluation, tools selection, automation development, testing, deployment, and maintenance
  - Identify skilled personnel and involve them in the CoE set up to help accelerate the learning phase of the CoE
  - Consider bringing in external consultants to speed skills development and transfer and augment or complement internal skills
  - Given the shortage of Smart RPA skills, organizations should look at sourcing skills from different geographic locations

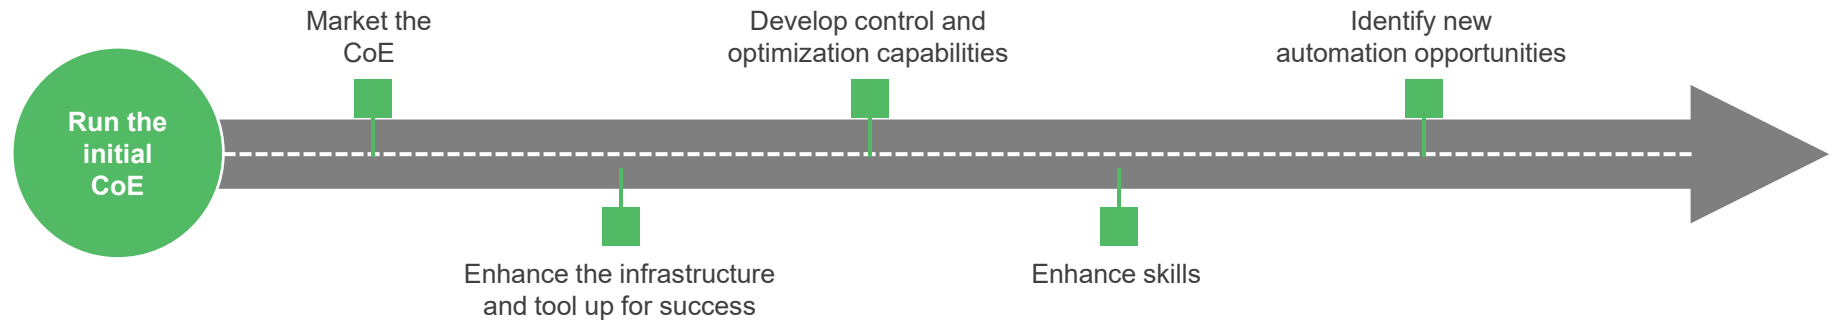

# Build the initial CoE: Bring together software tools and expertise, wrapped in a governance framework

## Typical activities within each step

# Run the initial CoE: From the beginning, a CoE has to be marketed and tooled up for success

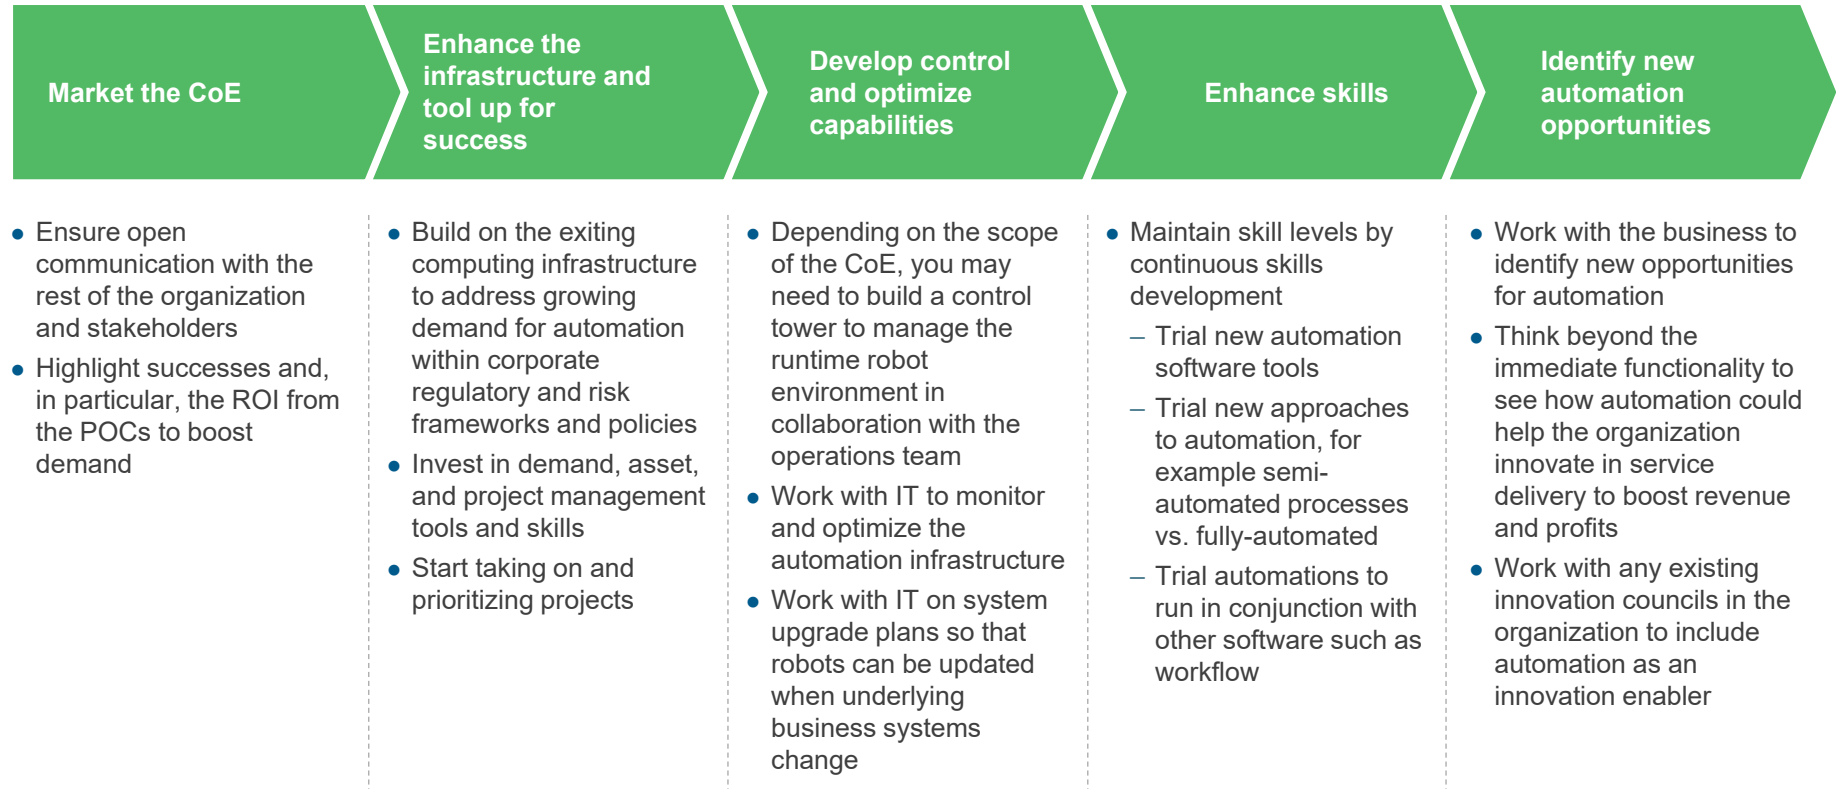

## Rationale behind the steps

- Success at the POC stage will help boost demand for the CoE's services
  - Ensure data capture to quantitatively demonstrate the benefits that have been realized
  - Use the data to market the CoE to business units
- You will need to enhance the infrastructure and get more software tools, such as collaboration and project management applications, to run the CoE and automations efficiently. Build your capabilities to manage:
  - Customer demand and workloads
  - Automation performance monitoring and controls
- Demand for CoE services is sure to go up; you will need to be able to prioritize what you take on
  - Work with stakeholders to identify which processes, when automated, would relieve the organization of its biggest pain points or are of strategic importance
  - Prioritize the CoE's work accordingly

# Run the initial CoE: Start taking on new requirements from the business while communicating the benefits realized by the POCs

## Typical activities within each step

# Scaling up an automation CoE: Scale multiplies the benefits of automation and the scaling up is key to it

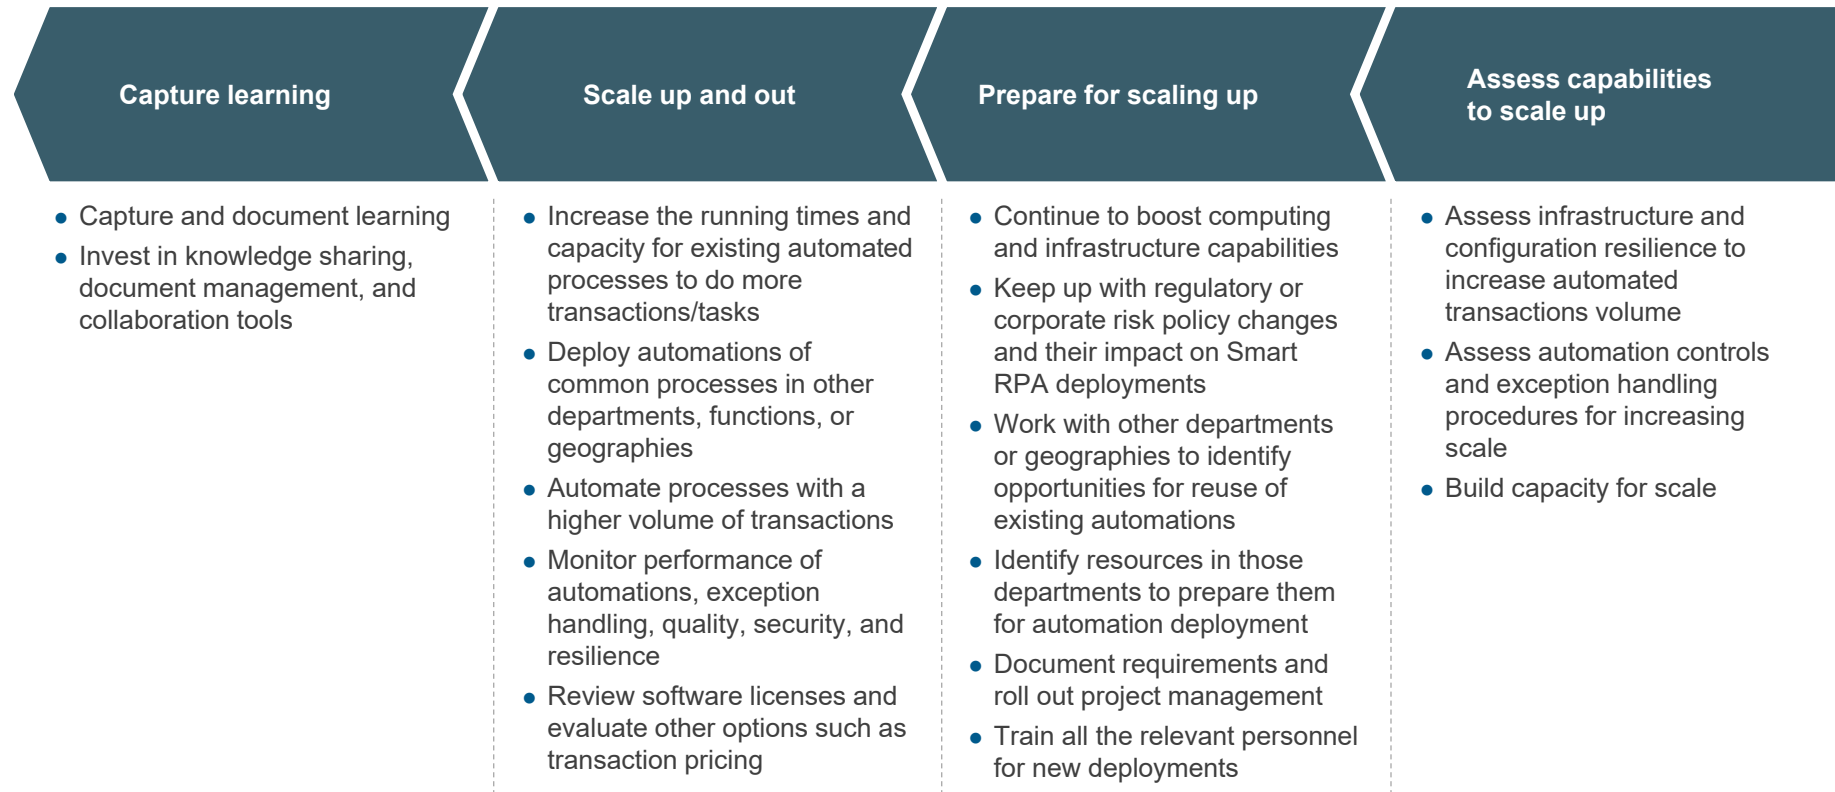

## Rationale behind the steps

- The automation infrastructure, its configuration, and the degree of optimization of the virtualized run time environment for Smart RPA will make a difference to the program's performance
- It is, therefore, important that you expand and optimize the environment to scale up
- Organizations that have successfully scaled up have done so by
  - Addressing infrastructure needs of Smart RPA
  - Automating the same processes in another department, function, or geography
  - Increasing the number of robots to automate more of the same types of transactions
  - Tried new automations for larger volume transactions after smaller trials
- The organization will need enhanced automation management and controls to manage larger deployments
  - Address this need through third-party control and monitoring software or develop your own approach to an aggregated view of the automated estate
- As the scale of automation within the organization increases, the CoE should review its software licensing cost and evaluate opportunities for transaction or on-demand-based pricing

# Scaling up operations: Assess capacity and resilience of infrastructure and enhance skills before scaling up

## Typical activities within each step

# Running and expanding an automation CoE is a closed loop process

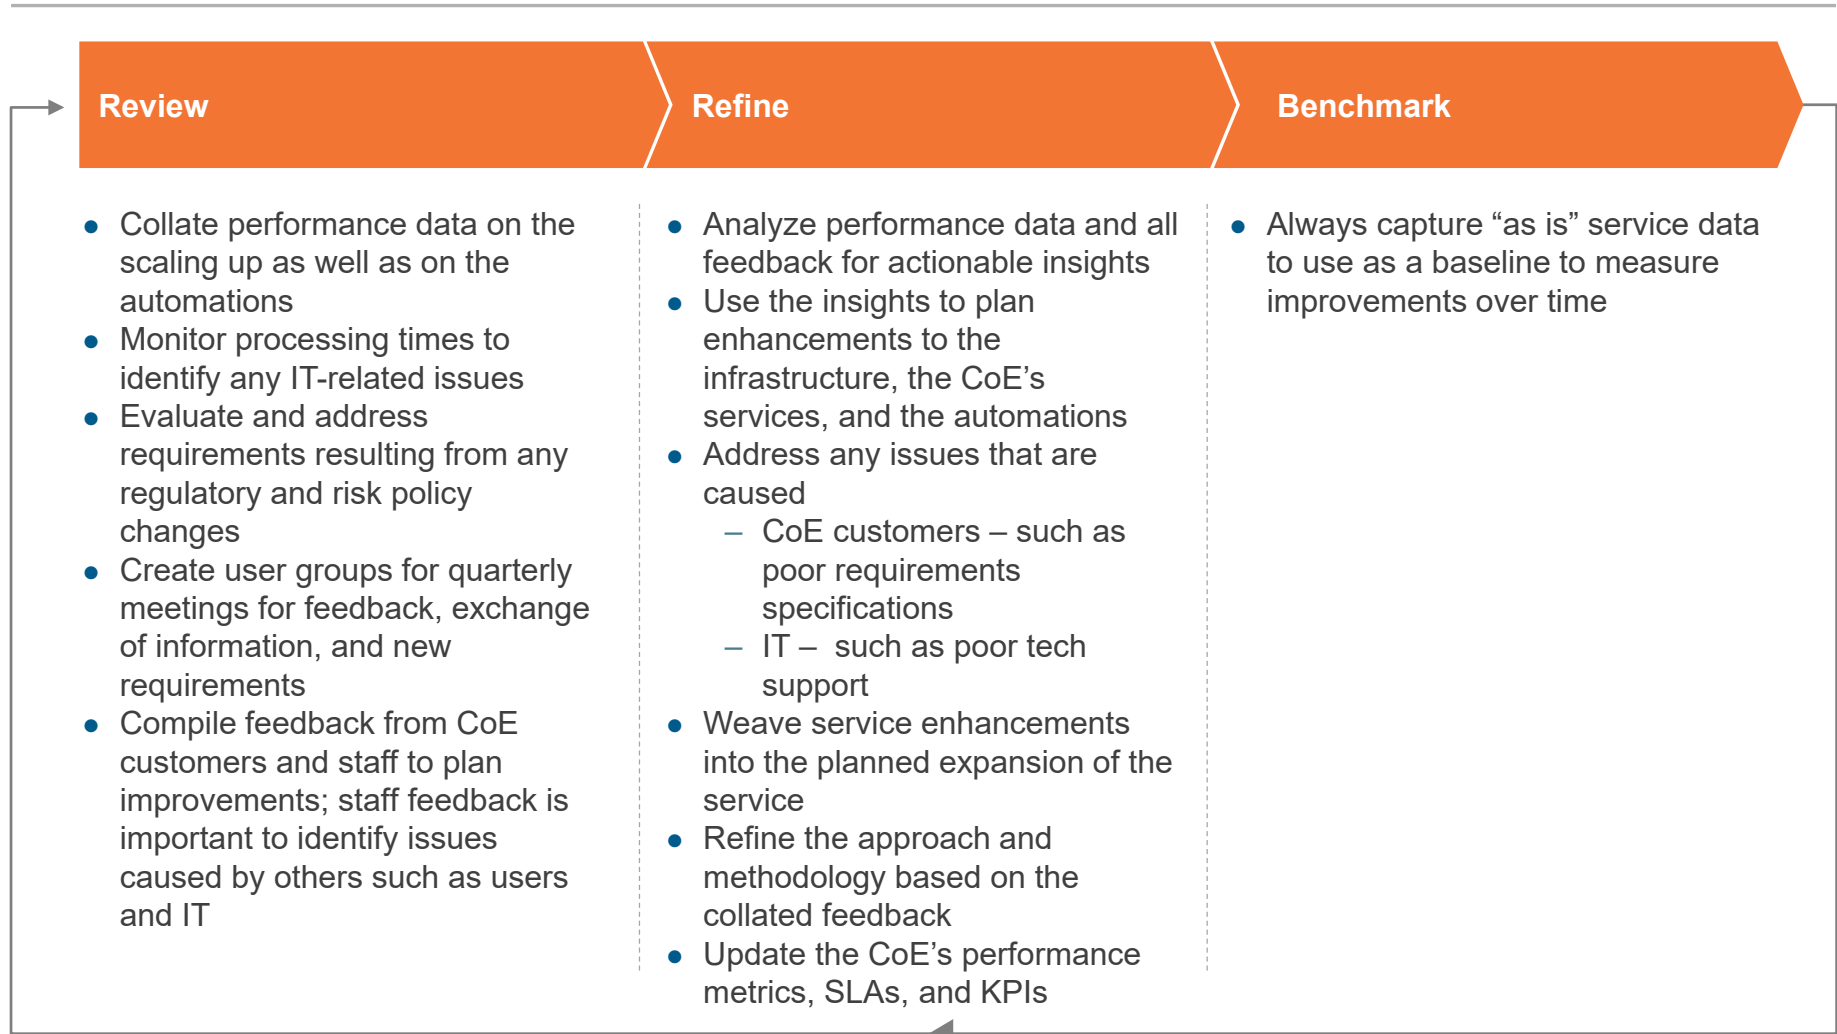

## Review and refine the CoE: Monitor and review the CoE's performance as part of a closed loop process

### Running a CoE should be a closed-loop process

- Collect and monitor performance data, such as key performance indicators and user feedback
- Review IT infrastructure and address issues and gaps
- Address the impact of changes in regulatory or corporate risk policies
- Review automated operations and feed the findings into the continuous improvement cycle

# Review and refine the CoE: Leverage benchmarking to feed data into the review and refine processes

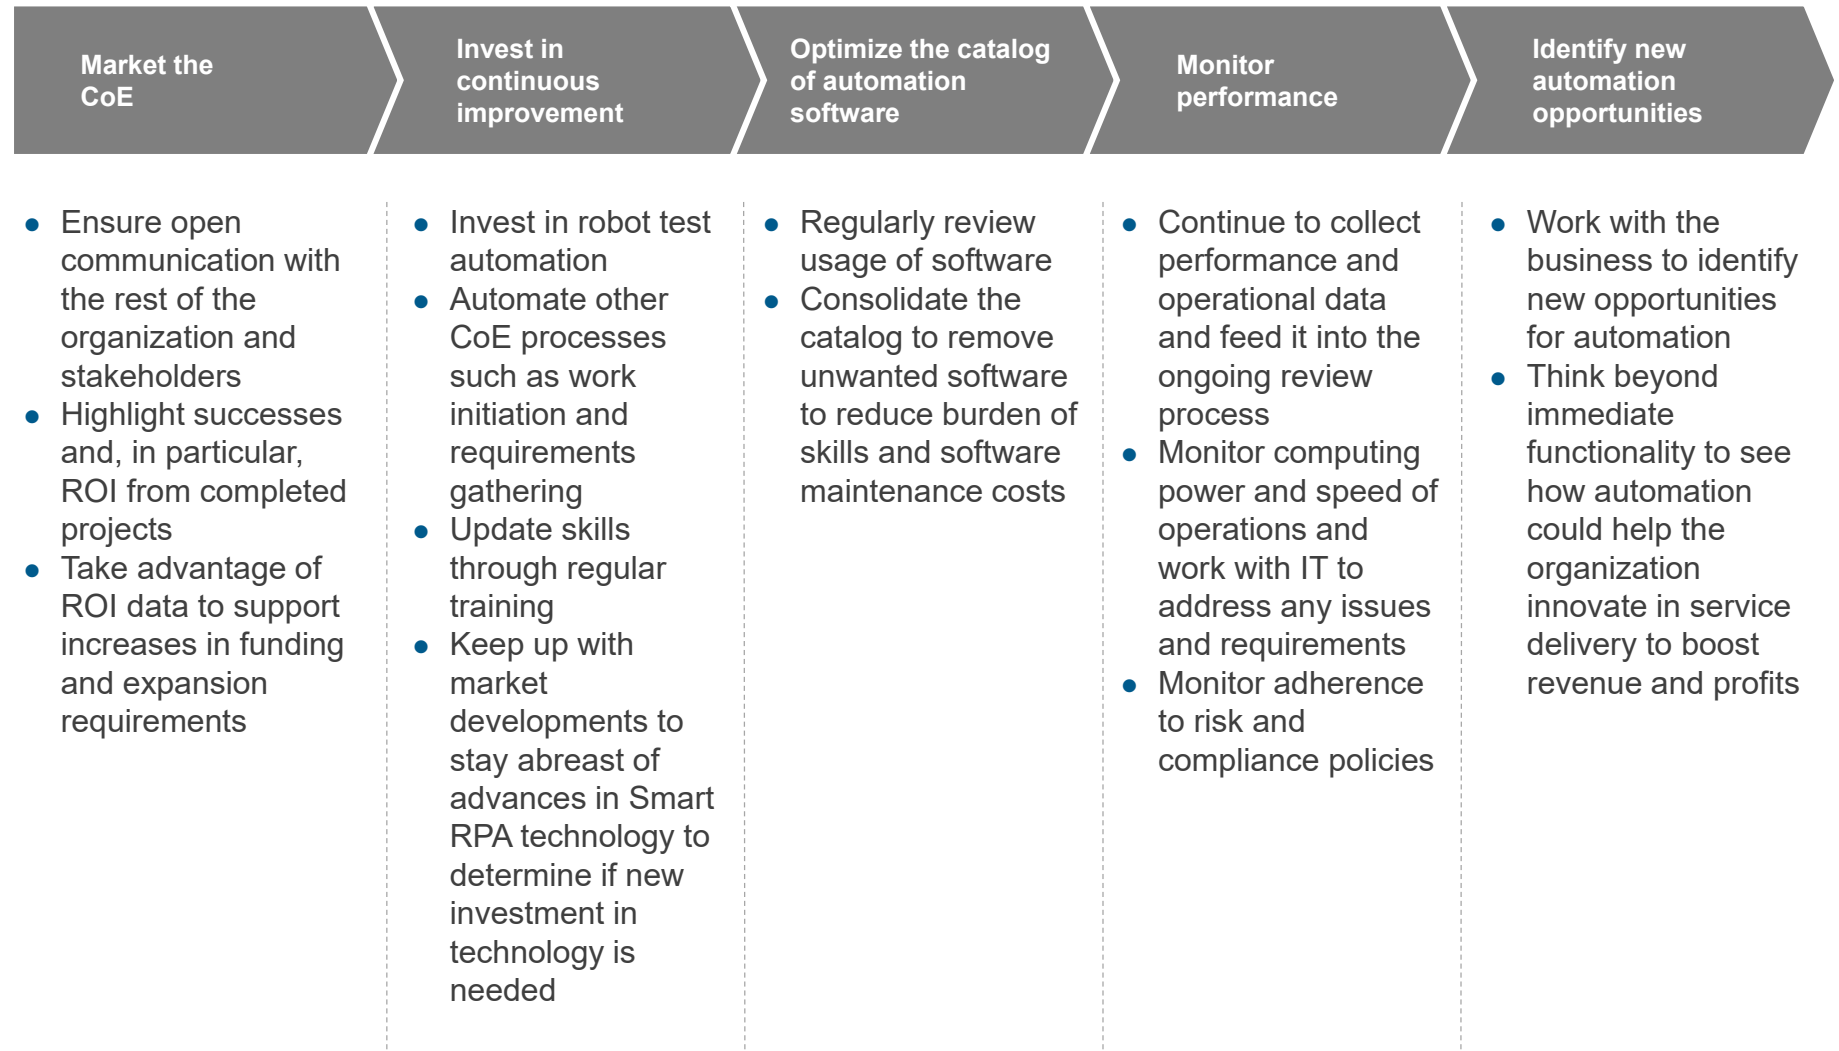

# Run the CoE: Use lessons learned from running the initial CoE to embed best practices in the full-scale run environment

## Rationale behind the steps

- Activities that were part of the running of the initial CoE get embedded into the full scale version, enhanced with lessons learned and best practices
  - The activities include CoE marketing, continuous improvement, and reporting and monitoring
  - The closed loop form of reviewing and refining should provide insights and intelligence as well as help highlight potential enhancements and continuous improvement
- As the initial CoE matures and the skill base becomes deeper and wider, it should become easier to spot new opportunities for automation as well as new approaches to it and service delivery innovation

# Run the CoE: Continuous monitoring and improvements are core parts of the steady state of running operations

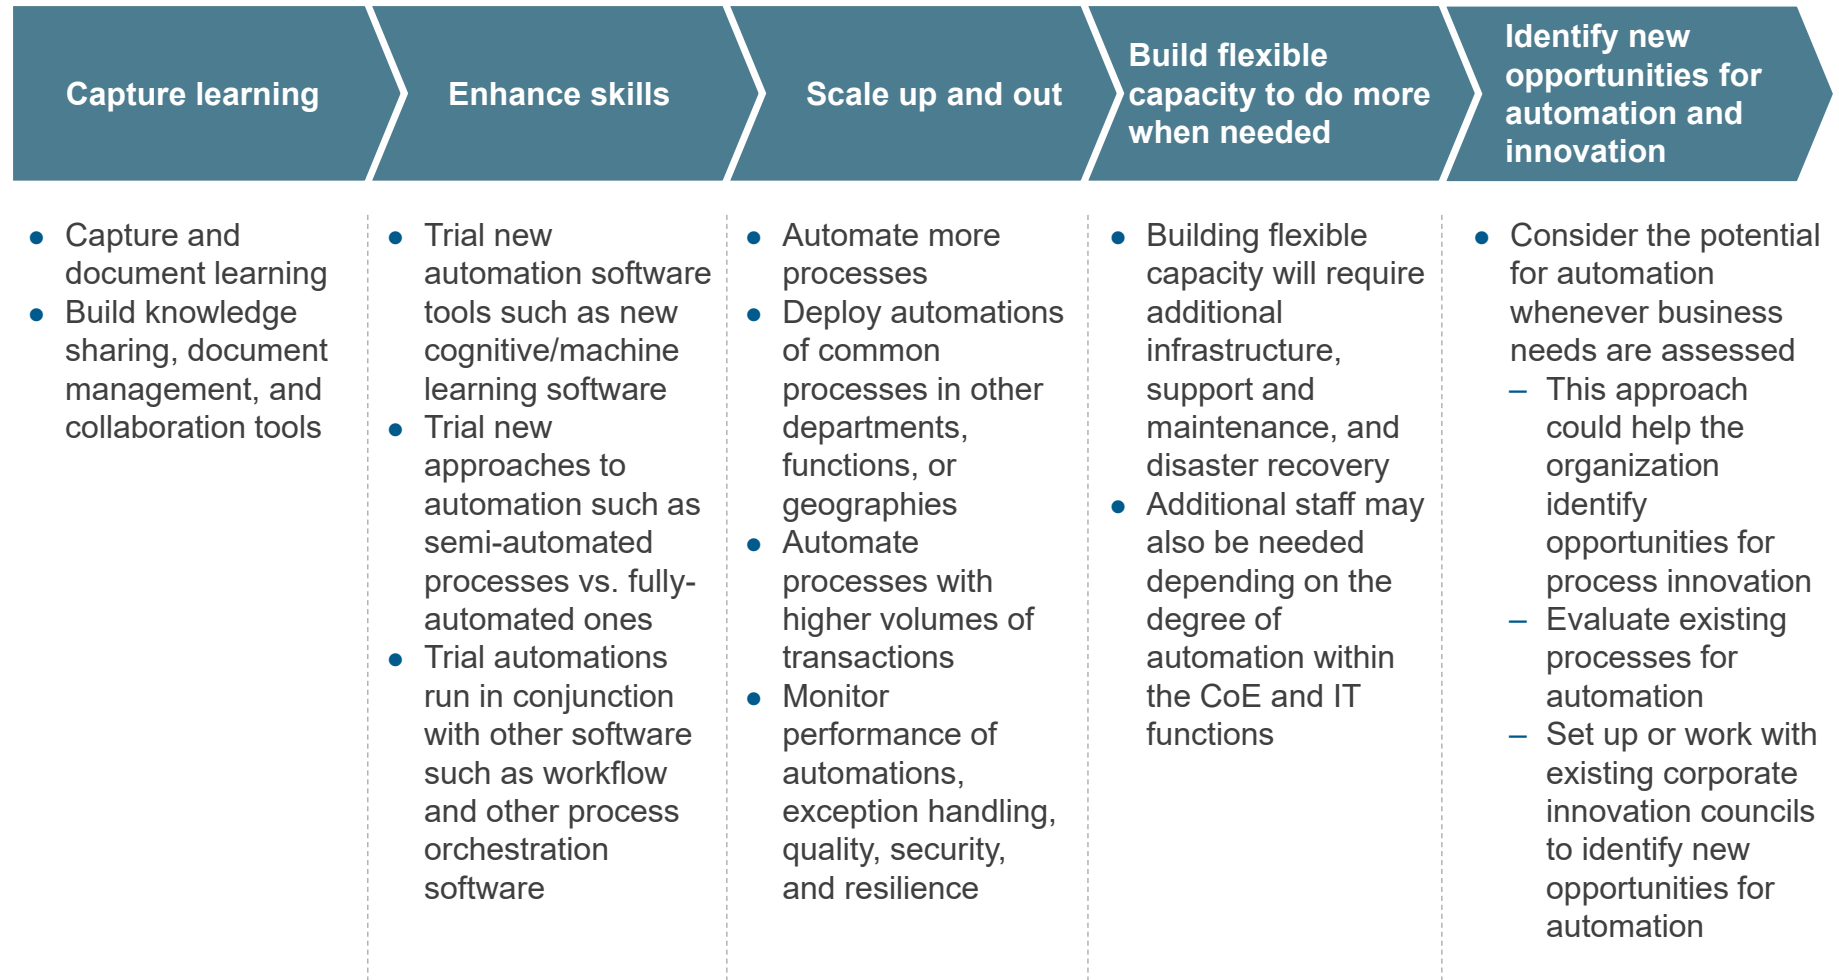

# Expand the CoE: Changing perspectives to look at processes through the lens of automation can lead to innovation

## Rational behind the steps

- As the level of automation skills in the organization increases, reviews of operations can be done increasingly through the lens of automation: how can the processes be modernized, digitized, and automated? Using this lens could lead to new ways of delivering services and innovation in business
- Flexible scalability using cloud or utility offerings should help the CoE build scale as and when it is needed to deal with demand and capacity fluctuations
- The CoE should try to automate as many of its own processes as it can; doing so will enhance its flexibility and expertise
- The CoE should keep up with developments in automation technologies and deploy more advanced products if the business could benefit from them

# Expand the CoE: Enhancing skills and capturing lessons learned are essential parts of keeping the CoE relevant

## Glossary of key terms used in this report (page 1 of 2)

Term	Definition
Artificial intelligence	Artificial intelligence is referred as the ability of the system to use its cognitive intelligence to learn how to interpret unstructured content, use relationships and patterns to build a fuzzy structure around it, and then leverage this structure to respond in a similar form as the input itself
BPM tools	Business Process Management tools are process optimization solutions with process design, execution (through workflows and orchestration of different BPS technology systems), and monitoring (through analytics) capabilities
BPO	Business Process Outsourcing refers to the purchase of one or more processes or functions from a company in the business of providing such services at large or as a third-party provider
Buyer	The company/entity that purchases outsourcing services from a provider of such services
Cognitive automation	Cognitive automation refers to the ability of a system to learn how to interpret unstructured content, such as natural language, and use analytical capability to derive and present inferences in a pre-defined/structured fashion – for example, a system that classifies a person's mood into a pre-defined bucket based on his/her tone and language
FTE-based pricing	Input-based pricing structure; priced per resource type with significant price differences between onshore and offshore (such as per onshore clerk and per offshore clerk)
FTEs	Full-time equivalent is a unit that indicates the workload of an employed person
GIC	Global In-house Center is a shared service or delivery center owned and run by a parent organization
Horizontal business processes	Horizontal business processes refer to those processes that are common across the various departments in an organization and are often not directly related to the key revenue-earning business. Examples include procurement, finance & accounting, and human resource management
NLP	Natural Language Processing is a cognitive intelligence-based methodology to interpret human languages
Offshoring	Transferring activities or ownership of a complete business process to a different country from the country (or countries) where the company receiving the services is located. This transfer is done primarily for the purpose of gaining access to a lower-cost labor market, but may also be done to gain access to additional skilled labor, to establish a business presence in a foreign country, etc. Companies may utilize offshoring either through an outsourcing arrangement with a third party or by establishing their own Global In-house Centers (GICs) in offshore locations, among other business structures
POC	Proof of Concept is a realization of a certain method or idea in order to demonstrate its feasibility or a demonstration in principle with the aim of verifying that some concept or theory has practical potential

## Glossary of key terms used in this report (page 2 of 2)

Term	Definition
RDA	RDA of attended RPAs that are deployed on user desktops; these are triggered by users instead of being orchestrated from a central control tower
Semi-structured data	Semi-structured data is content that does not conform to a pre-defined structure but nonetheless contains tags / other markers to separate semantic elements and enforce hierarchies. In short, it has a self-describing structure. The placeholders of the content can be in varied sequences
Structured data	Structured data is content that conforms to the pre-defined structure of content in terms of tags to separate semantic elements and enforce hierarchies of records and fields. Moreover, the placeholders for the content have a pre-defined sequence
Transaction-based pricing	An output-based pricing structure priced per unit transaction with significant price differences between onshore and offshore
Unstructured data	Unstructured content refers to information that either does not have a pre-defined data model or is not organized in a pre-defined manner. Unstructured information is typically text-heavy, but may contain data such as dates, and numbers
Vertical-specific business processes	Vertical-specific business processes refer to those processes that are specific to a department within an organization and are often directly related to the key revenue-earning business. Examples include lending process in the banking industry and claims processing in the insurance industry

## About Everest Group

Everest Group is a consulting and research firm focused on strategic IT, business services, and sourcing. We are trusted advisors to senior executives of leading enterprises, providers, and investors. Our firm helps clients improve operational and financial performance through a hands-on process that supports them in making well-informed decisions that deliver high-impact results and achieve sustained value. Our insight and guidance empower clients to improve organizational efficiency, effectiveness, agility, and responsiveness. What sets Everest Group apart is the integration of deep sourcing knowledge, problem-solving skills and original research. Details and in-depth content are available at [www.everestgrp.com](http://www.everestgrp.com).
